

# Workbench APIs

---

[Workspace Kind \[kubeflow.org/](#) [Workspace \[kubeflow.org/v1beta1\]](#)

# Workspace Kind [kubeflow.org/v1beta1]

## Description

WorkspaceKind is the Schema for the WorkspaceKinds API

## Type

object

## Specification

Property	Type	Description
<code>apiVersion</code>	<code>string</code>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<code>kind</code>	<code>string</code>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<code>metadata</code>	<code>ObjectMeta</code> ↗	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
<code>spec</code>	<code>object</code>	WorkspaceKindSpec defines the desired state of WorkspaceKind
<code>status</code>	<code>object</code>	WorkspaceKindStatus defines the observed state of WorkspaceKind

## .spec

### Description

WorkspaceKindSpec defines the desired state of WorkspaceKind

### Type

`object`

### Required

`podTemplate`

`spawner`

Property	Type	Description
<code>podTemplate</code>	<code>object</code>	podTemplate is the PodTemplate used to spawn Pods to run Workspaces of this WorkspaceKind
<code>spawner</code>	<code>object</code>	spawner config determines how the WorkspaceKind is displayed in the Workspace Spawner UI

# .spec.podTemplate

## Description

podTemplate is the PodTemplate used to spawn Pods to run Workspaces of this WorkspaceKind

## Type

object

## Required

options

serviceAccount

volumeMounts

Property	Type	Description
<code>containerSecurityContext</code>	object	container security context for Workspace Pods (MUTABLE)
<code>culling</code>	object	culling configs for pausing inactive Workspaces (MUTABLE)
<code>extraEnv</code>	array	<p>environment variables for Workspace Pods (MUTABLE)</p> <ul style="list-style-type: none"> <li>the following go template functions are available: <ul style="list-style-type: none"> <li><code>httpPathPrefix(portId string)</code>: returns the HTTP path prefix of the specified port</li> </ul> </li> </ul>
<code>extraVolumeMounts</code>	array	extra volume mounts for Workspace Pods (MUTABLE)

Property	Type	Description
<code>extraVolumes</code>	<code>array</code>	extra volumes for Workspace Pods (MUTABLE)
<code>httpProxy</code>	<code>object</code>	http proxy configs (MUTABLE)
<code>options</code>	<code>object</code>	options are the user-selectable fields, they determine the PodSpec of the Workspace
<code>podMetadata</code>	<code>object</code>	metadata for Workspace Pods (MUTABLE)
<code>probes</code>	<code>object</code>	standard probes to determine Container health (MUTABLE)
<code>securityContext</code>	<code>object</code>	security context for Workspace Pods (MUTABLE)
<code>serviceAccount</code>	<code>object</code>	service account configs for Workspace Pods
<code>volumeMounts</code>	<code>object</code>	volume mount paths

## `.spec.podTemplate.containerSecurityContext`

### Description

## container security context for Workspace Pods (MUTABLE)

## Type

object

Property	Type	Description
<code>allowPrivilegeEscalation</code>	boolean	<p>AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the <code>no_new_privs</code> flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is:</p> <ol style="list-style-type: none"> <li>run as Privileged</li> <li>has <code>CAP_SYS_ADMIN</code> Note that this field cannot be set when <code>spec.os.name</code> is <code>windows</code>.</li> </ol>
<code>appArmorProfile</code>	object	<p><code>appArmorProfile</code> is the AppArmor options to use by this container. If set, this profile overrides the pod's <code>appArmorProfile</code>. Note that this field cannot be set when <code>spec.os.name</code> is <code>windows</code>.</p>
<code>capabilities</code>	object	<p>The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime. Note that this field cannot be set when <code>spec.os.name</code> is <code>windows</code>.</p>
<code>privileged</code>	boolean	<p>Run container in privileged mode. Processes in privileged containers are essentially</p>

Property	Type	Description
		equivalent to root on the host. Defaults to false. Note that this field cannot be set when spec.os.name is windows.
procMount	string	procMount denotes the type of proc mount to use for the containers. The default value is Default which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled. Note that this field cannot be set when spec.os.name is windows.
readOnlyRootFilesystem	boolean	Whether this container has a read-only root filesystem. Default is false. Note that this field cannot be set when spec.os.name is windows.
runAsGroup	integer	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
runAsNonRoot	boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that

Property	Type	Description
		it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
<code>runAsUser</code>	<code>integer</code>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<code>seLinuxOptions</code>	<code>object</code>	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.
<code>seccompProfile</code>	<code>object</code>	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options. Note that

Property	Type	Description
		this field cannot be set when spec.os.name is windows.
<code>windowsOptions</code>	<code>object</code>	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

## `.spec.podTemplate.containerSecurityContext.appArmorProfile`

### Description

`appArmorProfile` is the AppArmor options to use by this container. If set, this profile overrides the pod's `appArmorProfile`. Note that this field cannot be set when `spec.os.name` is windows.

### Type

`object`

### Required

`type`

Property	Type	Description
<code>localhostProfile</code>	<code>string</code>	<code>localhostProfile</code> indicates a profile loaded on the node that should be used. The profile must be preconfigured on the node to work. Must match the loaded name of the profile. Must be set if and only if <code>type</code> is "Localhost".
<code>type</code>	<code>string</code>	<code>type</code> indicates which kind of AppArmor profile will be applied. Valid options are: <code>Localhost</code> - a profile pre-loaded on the node. <code>RuntimeDefault</code> - the container runtime's default profile. <code>Unconfined</code> - no AppArmor enforcement.

## `.spec.podTemplate.containerSecurityContext.capabilities`

### Description

The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime. Note that this field cannot be set when `spec.os.name` is `windows`.

### Type

`object`

Property	Type	Description
<code>add</code>	<code>array</code>	Added capabilities
<code>drop</code>	<code>array</code>	Removed capabilities

## **.spec.podTemplate.containerSecurityContext.capabilities. add**

### **Description**

Added capabilities

### **Type**

array

## **.spec.podTemplate.containerSecurityContext.capabilities. add[]**

### **Description**

Capability represent POSIX capabilities type

### **Type**

string

## **.spec.podTemplate.containerSecurityContext.capabilities. drop**

### **Description**

Removed capabilities

### **Type**

array

## **.spec.podTemplate.containerSecurityContext.capabilities. drop[]**

### **Description**

Capability represent POSIX capabilities type

### **Type**

`string`

## `.spec.podTemplate.containerSecurityContext.seLinuxOptions`

### Description

The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is windows.

### Type

`object`

Property	Type	Description
<code>level</code>	<code>string</code>	Level is SELinux level label that applies to the container.
<code>role</code>	<code>string</code>	Role is a SELinux role label that applies to the container.
<code>type</code>	<code>string</code>	Type is a SELinux type label that applies to the container.
<code>user</code>	<code>string</code>	User is a SELinux user label that applies to the container.

## `.spec.podTemplate.containerSecurityContext.seccompProfile`

### Description

The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options. Note that this field cannot be set when spec.os.name is windows.

## Type

object

## Required

type

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must be set if type is "Localhost". Must NOT be set for any other type.
type	string	type indicates which kind of seccomp profile will be applied. Valid options are:  Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

## .spec.podTemplate.containerSecurityContext.windowOptions

### Description

The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the

value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

## Type

object

Property	Type	Description
<code>gmsaCredentialSpec</code>	string	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ↗) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
<code>gmsaCredentialSpecName</code>	string	<code>GMSACredentialSpecName</code> is the name of the GMSA credential spec to use.
<code>hostProcess</code>	boolean	<code>HostProcess</code> determines if a container should be run as a 'Host Process' container. All of a Pod's containers must have the same effective <code>HostProcess</code> value (it is not allowed to have a mix of <code>HostProcess</code> containers and non- <code>HostProcess</code> containers). In addition, if <code>HostProcess</code> is true then <code>HostNetwork</code> must also be set to true.
<code>runAsUserName</code>	string	The <code>UserName</code> in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in <code>PodSecurityContext</code> . If set in both <code>SecurityContext</code> and <code>PodSecurityContext</code> , the

Property	Type	Description
		value specified in SecurityContext takes precedence.

## .spec.podTemplate.culling

### Description

culling configs for pausing inactive Workspaces (MUTABLE)

### Type

object

### Required

activityProbe

Property	Type	Description
activityProbe	object	the probe used to determine if the Workspace is active
enabled	boolean	if the culling feature is enabled
maxInactiveSeconds	integer	the maximum number of seconds a Workspace can be inactive

## .spec.podTemplate.culling.activityProbe

### Description

the probe used to determine if the Workspace is active

### Type

object

Property	Type	Description
exec	object	<p>a shell command probe</p> <ul style="list-style-type: none"> <li>if the Workspace had activity in the last 60 seconds this command should return status 0, otherwise it should return status 1</li> </ul>
jupyter	object	<p>a Jupyter-specific probe</p> <ul style="list-style-type: none"> <li>will poll the <code>/api/status</code> endpoint of the Jupyter API, and use the <code>last_activity</code> field</li> <li>note, users need to be careful that their other probes don't trigger a "last_activity" update e.g. they should only check the health of Jupyter using the <code>/api/status</code> endpoint</li> </ul>

## .spec.podTemplate.culling.activityProbe.exec

### Description

a shell command probe - if the Workspace had activity in the last 60 seconds this command should return status 0, otherwise it should return status 1

### Type

object

### Required

command

Property	Type	Description
<code>command</code>	<code>array</code>	the command to run

## `.spec.podTemplate.culling.activityProbe.exec.command`

### Description

the command to run

### Type

`array`

## `.spec.podTemplate.culling.activityProbe.exec.command[]`

### Type

`string`

## `.spec.podTemplate.culling.activityProbe.jupyter`

### Description

a Jupyter-specific probe - will poll the `/api/status` endpoint of the Jupyter API, and use the `last_activity` field - note, users need to be careful that their other probes don't trigger a "last\_activity" update e.g. they should only check the health of Jupyter using the `/api/status` endpoint

### Type

`object`

### Required

`lastActivity`

Property	Type	Description
<code>lastActivity</code>	<code>boolean</code>	if the Jupyter-specific probe is enabled

## `.spec.podTemplate.extraEnv`

### Description

environment variables for Workspace Pods (MUTABLE) - the following go template functions are available: - `httpPathPrefix(portId string)`: returns the HTTP path prefix of the specified port

### Type

`array`

## `.spec.podTemplate.extraEnv[]`

### Description

EnvVar represents an environment variable present in a Container.

### Type

`object`

### Required

`name`

Property	Type	Description
<code>name</code>	<code>string</code>	Name of the environment variable. Must be a C_IDENTIFIER.
<code>value</code>	<code>string</code>	Variable references <code>\$(VAR_NAME)</code> are expanded using the previously defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged.

Property	Type	Description
		Double \$\$ are reduced to a single \$, which allows for escaping the \$(VAR_NAME) syntax: i.e. "\$\$(VAR_NAME)" will produce the string literal "\$(VAR_NAME)". Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
<code>valueFrom</code>	<code>object</code>	Source for the environment variable's value. Cannot be used if value is not empty.

## `.spec.podTemplate.extraEnv[].valueFrom`

### Description

Source for the environment variable's value. Cannot be used if value is not empty.

### Type

`object`

Property	Type	Description
<code>configMapKeyRef</code>	<code>object</code>	Selects a key of a ConfigMap.
<code>fieldRef</code>	<code>object</code>	Selects a field of the pod: supports metadata.name, metadata.namespace, <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
<code>resourceFieldRef</code>	<code>object</code>	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory,

Property	Type	Description
		limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
<code>secretKeyRef</code>	<code>object</code>	Selects a key of a secret in the pod's namespace

## `.spec.podTemplate.extraEnv[].valueFrom.configMapKeyRef`

### Description

Selects a key of a ConfigMap.

### Type

`object`

### Required

`key`

Property	Type	Description
<code>key</code>	<code>string</code>	The key to select.
<code>name</code>	<code>string</code>	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Property	Type	Description
<code>optional</code>	<code>boolean</code>	Specify whether the ConfigMap or its key must be defined

## `.spec.podTemplate.extraEnv[].valueFrom.fieldRef`

### Description

Selects a field of the pod: supports `metadata.name`, `metadata.namespace`, ``metadata.labels[<KEY>]``, ``metadata.annotations[<KEY>]``, `spec.nodeName`, `spec.serviceAccountName`, `status.hostIP`, `status.podIP`, `status.podIPs`.

### Type

`object`

### Required

`fieldPath`

Property	Type	Description
<code>apiVersion</code>	<code>string</code>	Version of the schema the FieldPath is written in terms of, defaults to "v1".
<code>fieldPath</code>	<code>string</code>	Path of the field to select in the specified API version.

## `.spec.podTemplate.extraEnv[].valueFrom.resourceFieldRef`

### Description

Selects a resource of the container: only resources limits and requests (`limits.cpu`, `limits.memory`, `limits.ephemeral-storage`, `requests.cpu`, `requests.memory` and `requests.ephemeral-storage`) are currently supported.

**Type**

object

**Required**

resource

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars
divisor		Specifies the output format of the exposed resources, defaults to "1"
resource	string	Required: resource to select

**.spec.podTemplate.extraEnv[].valueFrom.secretKeyRef****Description**

Selects a key of a secret in the pod's namespace

**Type**

object

**Required**

key

Property	Type	Description
key	string	The key of the secret to select from. Must be a valid secret key.

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a> ↗
optional	boolean	Specify whether the Secret or its key must be defined

## .spec.podTemplate.extraVolumeMounts

### Description

extra volume mounts for Workspace Pods (MUTABLE)

### Type

array

## .spec.podTemplate.extraVolumeMounts[]

### Description

VolumeMount describes a mounting of a Volume within a container.

### Type

object

### Required

mountPath

name

Property	Type	Description
<code>mountPath</code>	<code>string</code>	Path within the container at which the volume should be mounted. Must not contain ':'.
<code>mountPropagation</code>	<code>string</code>	<code>mountPropagation</code> determines how mounts are propagated from the host to container and the other way around. When not set, <code>MountPropagationNone</code> is used. This field is beta in 1.10. When <code>RecursiveReadOnly</code> is set to <code>IfPossible</code> or to <code>Enabled</code> , <code>MountPropagation</code> must be <code>None</code> or unspecified (which defaults to <code>None</code> ).
<code>name</code>	<code>string</code>	This must match the Name of a Volume.
<code>readOnly</code>	<code>boolean</code>	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
<code>recursiveReadOnly</code>	<code>string</code>	<code>RecursiveReadOnly</code> specifies whether read-only mounts should be handled recursively.  If <code>ReadOnly</code> is false, this field has no meaning and must be unspecified.  If <code>ReadOnly</code> is true, and this field is set to <code>Disabled</code> , the mount is not made recursively read-only. If this field is set to <code>IfPossible</code> , the mount is made recursively read-only, if it is supported by the container runtime. If this field is set to <code>Enabled</code> , the mount is made recursively read-only if it is supported by the container runtime, otherwise the pod will not

Property	Type	Description
		<p>be started and an error will be generated to indicate the reason.</p> <p>If this field is set to IfPossible or Enabled, MountPropagation must be set to None (or be unspecified, which defaults to None).</p> <p>If this field is not specified, it is treated as an equivalent of Disabled.</p>
<code>subPath</code>	<code>string</code>	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
<code>subPathExpr</code>	<code>string</code>	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

## `.spec.podTemplate.extraVolumes`

### Description

extra volumes for Workspace Pods (MUTABLE)

### Type

`array`

## `.spec.podTemplate.extraVolumes[]`

## Description

Volume represents a named volume in a pod that may be accessed by any container in the pod.

## Type

object

## Required

name

Property	Type	Description
<code>awsElasticBlockStore</code>	object	<code>awsElasticBlockStore</code> represents an AWS Disk resource on a kubelet's host machine and then exposed to the pod. <a href="https://kubernetes.io/docs/concepts/storage/volumes#aws-elastic-block-store">https://kubernetes.io/docs/concepts/storage/volumes#aws-elastic-block-store</a>
<code>azureDisk</code>	object	<code>azureDisk</code> represents an Azure Data Disk mount on the host and mounted to the pod.
<code>azureFile</code>	object	<code>azureFile</code> represents an Azure File Service mount on the host and mounted to the pod.
<code>cephfs</code>	object	<code>cephfs</code> represents a Ceph FS mount on the host that shares a pod's lifetime
<code>cinder</code>	object	<code>cinder</code> represents a cinder volume attached and mounted on the host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/">https://examples.k8s.io/mysql-cinder-pd/</a>

Property	Type	Description
<code>configMap</code>	object	configMap represents a configMap that should populate
<code>csi</code>	object	csi (Container Storage Interface) represents ephemera handled by certain external CSI drivers (Beta feature).
<code>downwardAPI</code>	object	downwardAPI represents downward API about the pod populate this volume
<code>emptyDir</code>	object	emptyDir represents a temporary directory that shares More info: <a href="https://kubernetes.io/docs/concepts/storage/">https://kubernetes.io/docs/concepts/storage/</a>
<code>ephemeral</code>	object	<p>ephemeral represents a volume that is handled by a cl The volume's lifecycle is tied to the pod that defines it - before the pod starts, and deleted when the pod is rem</p> <p>Use this if: a) the volume is only needed while the pod i normal volumes like restoring from snapshot or capacit needed, c) the storage driver is specified through a stor the storage driver supports dynamic volume provisionir PersistentVolumeClaim (see EphemeralVolumeSource information on the connection between this volume typ PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-speci volumes that persist for longer than the lifecycle of an ii</p> <p>Use CSI for light-weight local ephemeral volumes if the meant to be used that way - see the documentation of t</p>

Property	Type	Description
		information.  A pod can use both types of ephemeral volumes and persistent volumes at the same time.
fc	object	fc represents a Fibre Channel resource that is attached to the host machine and then exposed to the pod.
flexVolume	object	flexVolume represents a generic volume resource that is dynamically provisioned/attached using an exec based plugin.
flocker	object	flocker represents a Flocker volume attached to a kubelet's host machine and then exposed to the pod. This depends on the Flocker control service being running on the host.
gcePersistentDisk	object	gcePersistentDisk represents a GCE Disk resource that is attached to kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gce-persistent-disk">https://kubernetes.io/docs/concepts/storage/volumes#gce-persistent-disk</a>
gitRepo	object	gitRepo represents a git repository at a particular revision. GitRepo is deprecated. To provision a container with a git repository, use an InitContainer that clones the repo using git, then use an EmptyDir into an InitContainer that clones the repo using git, then use the EmptyDir into the Pod's container.
glusterfs	object	glusterfs represents a Glusterfs mount on the host that is exposed to the pod at runtime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/">https://examples.k8s.io/volumes/glusterfs/</a>

Property	Type	Description
hostPath	object	<p>hostPath represents a pre-existing file or directory on the host that is directly exposed to the container. This is generally used for debugging agents or other privileged things that are allowed to see the host. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a></p>
image	object	<p>image represents an OCI object (a container image or artifact) mounted on the kubelet's host machine. The volume is available at startup depending on which PullPolicy value is provided:</p> <ul style="list-style-type: none"> <li>• Always: the kubelet always attempts to pull the reference. If the pull fails, container creation will fail.</li> <li>• Never: the kubelet never pulls the reference and only uses the local image or artifact. Container creation will fail if the reference is not present.</li> <li>• IfNotPresent: the kubelet pulls if the reference isn't already present on disk. Container creation will fail if the reference isn't present and pull fails.</li> </ul> <p>The volume gets re-resolved if the pod gets deleted and recreated, which means that new remote content will become available if there was a failure to resolve or pull the image during pod startup. This is different from starting and may add significant latency. Failures to resolve or pull a normal volume backoff and will be reported on the pod status message. The types of objects that may be mounted by this volume are defined by the container runtime implementation on a host. The minimum must include all valid types supported by the container runtime. The OCI object gets mounted in a single directory (spec.containers[].volumeMounts.mountPath) by merging the OCI layers in the same way as for container images. The volume is mounted read-only (ro) and non-executable files (noexec) are not supported (spec.containers[].volumeMounts.subpath). The field</p>

Property	Type	Description
		spec.securityContext.fsGroupChangePolicy has no effect.
iscsi	object	iscsi represents an ISCSI Disk resource that is attached to the host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
name	string	name of the volume. Must be a DNS_LABEL and unique within the namespace. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	object	nfs represents an NFS mount on the host that shares a local filesystem into the Kubernetes pod from a remote NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes/#nfs">https://kubernetes.io/docs/concepts/storage/volumes/#nfs</a>
persistentVolumeClaim	object	persistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes/#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes/#persistentvolumeclaims</a>
photonPersistentDisk	object	photonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	object	portworxVolume represents a portworx volume attached and mounted on kubelets host machine

Property	Type	Description
projected	object	projected items for all in one resources secrets, config downward API
quobyte	object	quobyte represents a Quobyte mount on the host that s lifetime
rbd	object	rbd represents a Rados Block Device mount on the hos pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	object	scaleIO represents a ScaleIO persistent volume attach Kubernetes nodes.
secret	object	secret represents a secret that should populate this vol <a href="https://kubernetes.io/docs/concepts/storage/volumes#s">https://kubernetes.io/docs/concepts/storage/volumes#s</a>
storageos	object	storageOS represents a StorageOS volume attached a Kubernetes nodes.
vsphereVolume	object	vsphereVolume represents a vSphere volume attached kubelets host machine

**.spec.podTemplate.extraVolumes[].awsElasticBlockStore**

## Description

awsElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info:

<https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore>

## Type

object

## Required

volumeID

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. 1 Ensure that the filesystem type is supported by the host operating sy Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspe More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblo">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblo</a>
partition	integer	partition is the partition in the volume that you want to mount. If omit the default is to mount by volume name. Examples: For volume /dev you specify the partition as "1". Similarly, the volume partition for /de is "0" (or you can leave the property empty).
readOnly	boolean	readOnly value true will force the readOnly setting in VolumeMounts info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblo">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblo</a>
volumeID	string	volumeID is unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info:

Property	Type	Description
		<a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblob">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblob</a>

## .spec.podTemplate.extraVolumes[].azureDisk

### Description

azureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.

### Type

object

### Required

diskName

diskURI

Property	Type	Description
<p> cachingMode </p>	<p> string </p>	<p> cachingMode is the Host Caching mode: None, Read Only, Read Write. </p>
<p> diskName </p>	<p> string </p>	<p> diskName is the Name of the data disk in the blob storage </p>
<p> diskURI </p>	<p> string </p>	<p> diskURI is the URI of data disk in the blob storage </p>
<p> fsType </p>	<p> string </p>	<p> fsType is Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. </p>

Property	Type	Description
<code>kind</code>	<code>string</code>	kind expected values are Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
<code>readOnly</code>	<code>boolean</code>	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

## `.spec.podTemplate.extraVolumes[].azureFile`

### Description

azureFile represents an Azure File Service mount on the host and bind mount to the pod.

### Type

`object`

### Required

`secretName`

`shareName`

Property	Type	Description
<code>readOnly</code>	<code>boolean</code>	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
<code>secretName</code>	<code>string</code>	secretName is the name of secret that contains Azure Storage Account Name and Key

Property	Type	Description
<code>shareName</code>	<code>string</code>	shareName is the azure share Name

## `.spec.podTemplate.extraVolumes[].cephfs`

### Description

cephFS represents a Ceph FS mount on the host that shares a pod's lifetime

### Type

`object`

### Required

`monitors`

Property	Type	Description
<code>monitors</code>	<code>array</code>	monitors is Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
<code>path</code>	<code>string</code>	path is Optional: Used as the mounted root, rather than the full Ceph tree, default is /
<code>readOnly</code>	<code>boolean</code>	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

Property	Type	Description
secretFile	string	secretFile is Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	object	secretRef is Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	string	user is optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

## `.spec.podTemplate.extraVolumes[].cephfs.monitors`

### Description

monitors is Required: Monitors is a collection of Ceph monitors More info: <https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it>

### Type

array

## `.spec.podTemplate.extraVolumes[].cephfs.monitors[]`

### Type

string

## .spec.podTemplate.extraVolumes[].cephfs.secretRef

### Description

secretRef is Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it>

### Type

object

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## .spec.podTemplate.extraVolumes[].cinder

### Description

cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <https://examples.k8s.io/mysql-cinder-pd/README.md>

### Type

object

### Required

volumeID

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if

Property	Type	Description
		unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a> ↗
<code>readOnly</code>	<code>boolean</code>	<code>readOnly</code> defaults to false (read/write). <code>ReadOnly</code> here will force the <code>ReadOnly</code> setting in <code>VolumeMounts</code> . More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a> ↗
<code>secretRef</code>	<code>object</code>	<code>secretRef</code> is optional: points to a secret object containing parameters used to connect to OpenStack.
<code>volumeID</code>	<code>string</code>	<code>volumeID</code> used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a> ↗

## `.spec.podTemplate.extraVolumes[].cinder.secretRef`

### Description

`secretRef` is optional: points to a secret object containing parameters used to connect to OpenStack.

### Type

`object`

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## .spec.podTemplate.extraVolumes[].configMap

### Description

configMap represents a configMap that should populate this volume

### Type

object

Property	Type	Description
defaultMode	integer	defaultMode is optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is

Property	Type	Description
		specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a> ↗
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

## `.spec.podTemplate.extraVolumes[].configMap.items`

### Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

### Type

array

## `.spec.podTemplate.extraVolumes[].configMap.items[]`

### Description

Maps a string key to a path within a volume.

## Type

object

## Required

key

path

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

## .spec.podTemplate.extraVolumes[].csi

### Description

csi (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).

### Type

object

### Required

driver

Property	Type	Description
<code>driver</code>	<code>string</code>	driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
<code>fsType</code>	<code>string</code>	fsType to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
<code>nodePublishSecretRef</code>	<code>object</code>	nodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
<code>readOnly</code>	<code>boolean</code>	readOnly specifies a read-only configuration for the volume. Defaults to false (read/write).
<code>volumeAttributes</code>	<code>object</code>	volumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

## `.spec.podTemplate.extraVolumes[].csi.nodePublishSecretRef`

### Description

`nodePublishSecretRef` is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI `NodePublishVolume` and `NodeUnpublishVolume` calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.

### Type

object

Property	Type	Description
<code>name</code>	<code>string</code>	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## `.spec.podTemplate.extraVolumes[].csi.volumeAttributes`

### Description

`volumeAttributes` stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

### Type

object

## `.spec.podTemplate.extraVolumes[].downwardAPI`

### Description

`downwardAPI` represents downward API about the pod that should populate this volume

### Type

object

Property	Type	Description
defaultMode	integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	Items is a list of downward API volume file

## **.spec.podTemplate.extraVolumes[].downwardAPI.items**

### **Description**

Items is a list of downward API volume file

### **Type**

array

## **.spec.podTemplate.extraVolumes[].downwardAPI.items[]**

### **Description**

DownwardAPIVolumeFile represents information to create the file containing the pod field

### **Type**

object

### **Required**

path

Property	Type	Description
<code>fieldRef</code>	<code>object</code>	Required: Selects a field of the pod: only annotations, labels, name, namespace and uid are supported.
<code>mode</code>	<code>integer</code>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume <code>defaultMode</code> will be used. This might be in conflict with other options that affect the file mode, like <code>fsGroup</code> , and the result can be other mode bits set.
<code>path</code>	<code>string</code>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the <code>'..'</code> path. Must be utf-8 encoded. The first item of the relative path must not start with <code>'..'</code>
<code>resourceFieldRef</code>	<code>object</code>	Selects a resource of the container: only resources limits and requests ( <code>limits.cpu</code> , <code>limits.memory</code> , <code>requests.cpu</code> and <code>requests.memory</code> ) are currently supported.

## `.spec.podTemplate.extraVolumes[].downwardAPI.items[].fieldRef`

### Description

Required: Selects a field of the pod: only annotations, labels, name, namespace and uid are supported.

**Type**

object

**Required**

fieldPath

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

## `.spec.podTemplate.extraVolumes[].downwardAPI.items[].resourceFieldRef`

**Description**

Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Type**

object

**Required**

resource

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars

Property	Type	Description
<code>divisor</code>		Specifies the output format of the exposed resources, defaults to "1"
<code>resource</code>	<code>string</code>	Required: resource to select

## `.spec.podTemplate.extraVolumes[].emptyDir`

### Description

`emptyDir` represents a temporary directory that shares a pod's lifetime. More info: <https://kubernetes.io/docs/concepts/storage/volumes#emptydir>

### Type

`object`

Property	Type	Description
<code>medium</code>	<code>string</code>	<p><code>medium</code> represents what type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a></p>
<code>sizeLimit</code>		<p><code>sizeLimit</code> is the total amount of local storage required for this <code>EmptyDir</code> volume. The size limit is also applicable for memory medium. The maximum usage on memory medium <code>EmptyDir</code> would be the minimum value between the <code>SizeLimit</code> specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More</p>

Property	Type	Description
		info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a> 

## .spec.podTemplate.extraVolumes[].ephemeral

### Description

ephemeral represents a volume that is handled by a cluster storage driver. The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed. Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see `EphemeralVolumeSource` for more information on the connection between this volume type and `PersistentVolumeClaim`). Use `PersistentVolumeClaim` or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod. Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information. A pod can use both types of ephemeral volumes and persistent volumes at the same time.

### Type

object

Property	Type	Description
<code>volumeClaimTemplate</code>	object	Will be used to create a stand-alone PVC to provision the volume. The pod in which this <code>EphemeralVolumeSource</code> is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <code>&lt;pod name&gt;-&lt;volume name&gt;</code> where <code>&lt;volume name&gt;</code> is the name from the <code>PodSpec.Volumes</code> array entry. Pod validation will reject the pod if the

Property	Type	Description
		<p>concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate`

### Description

Will be used to create a stand-alone PVC to provision the volume. The pod in which this `EphemeralVolumeSource` is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be `<pod name>-<volume name>` where `<volume name>` is the name from the `PodSpec.Volumes` array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long). An existing PVC with that name that is not owned by the pod will *\*not\** be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a

broken cluster. This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created. Required, must not be nil.

### Type

object

### Required

spec

Property	Type	Description
metadata	<a href="#">ObjectMeta</a>	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec`

### Description

The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

### Type

object

Property	Type	Description
accessModes	array	<p>accessModes contains the desired access modes volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a></p>
dataSource	object	<p>dataSource field can be used to specify either:</p> <ul style="list-style-type: none"> <li>An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot)</li> <li>An existing PVC (PersistentVolumeClaim) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. When the AnyVolumeDataSource feature gate is enabled, dataSource contents will be copied to dataSourceRef, and dataSourceRef contents will be copied to dataSource when dataSourceRef.namespace is not specified. If the namespace is specified, then dataSourceRef contents will not be copied to dataSource.</li> </ul>
dataSourceRef	object	<p>dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will require the functionality of the dataSource field and as such both fields are non-empty, they must have the same</p>

Property	Type	Description
		<p>value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef:</p> <ul style="list-style-type: none"> <li>• While dataSource only allows two specific type objects, dataSourceRef allows any non-core objects as well as PersistentVolumeClaim objects.</li> <li>• While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified.</li> <li>• While dataSource only allows local objects, dataSourceRef allows objects in any namespace. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.</li> </ul>

Property	Type	Description
resources	object	resources represents the minimum resources the volume should have. If RecoverVolumeExpansionFailure feature is enable users are allowed to specify resource requirement that are lower than previous value but must still be higher than capacity recorded in the status field of claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistentvolumes#resources">https://kubernetes.io/docs/concepts/storage/persistentvolumes#resources</a>
selector	object	selector is a label query over volumes to consider binding.
storageClassName	string	storageClassName is the name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistentvolumes#class-1">https://kubernetes.io/docs/concepts/storage/persistentvolumes#class-1</a>
volumeAttributesClassName	string	volumeAttributesClassName may be used to set the VolumeAttributesClass used by this claim. If specified the CSI driver will create or update the volume with attributes defined in the corresponding VolumeAttributesClass. This has a different purpose than storageClassName, it can be changed after the claim is created. An empty string value means that VolumeAttributesClass will be applied to the claim it's not allowed to reset this field to empty string once it is set. If unspecified and the PersistentVolumeClaim is unbound, the default VolumeAttributesClass will be used by the persistentvolume controller if it exists. If the

Property	Type	Description
		resource referred to by volumeAttributesClass does not exist, this PersistentVolumeClaim will be set to Pending state, as reflected by the modifyVolumeStatus field, until such as a resource exists. More info: <a href="https://kubernetes.io/docs/concepts/storage/volume-attributes-classes/">https://kubernetes.io/docs/concepts/storage/volume-attributes-classes/</a> (Beta) Using this field requires the VolumeAttributesClass feature gate to be enabled (off by default).
volumeMode	string	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	string	volumeName is the binding reference to the PersistentVolume backing this claim.

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.accessModes`

### Description

accessModes contains the desired access modes the volume should have. More info: <https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1>

### Type

array

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.accessModes[]`

### Type

string

## .spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.dataSource

### Description

dataSource field can be used to specify either: \* An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot) \* An existing PVC (PersistentVolumeClaim) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. When the AnyVolumeDataSource feature gate is enabled, dataSource contents will be copied to dataSourceRef, and dataSourceRef contents will be copied to dataSource when dataSourceRef.namespace is not specified. If the namespace is specified, then dataSourceRef will not be copied to dataSource.

### Type

object

### Required

kind

name

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	string	Kind is the type of resource being referenced
name	string	Name is the name of resource being referenced

# .spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.dataSourceRef

## Description

dataSourceRef specifies the object from which to populate the volume with data, if a non-empty volume is desired. This may be any object from a non-empty API group (non core object) or a PersistentVolumeClaim object. When this field is specified, volume binding will only succeed if the type of the specified object matches some installed volume populator or dynamic provisioner. This field will replace the functionality of the dataSource field and as such if both fields are non-empty, they must have the same value. For backwards compatibility, when namespace isn't specified in dataSourceRef, both fields (dataSource and dataSourceRef) will be set to the same value automatically if one of them is empty and the other is non-empty. When namespace is specified in dataSourceRef, dataSource isn't set to the same value and must be empty. There are three important differences between dataSource and dataSourceRef: \* While dataSource only allows two specific types of objects, dataSourceRef allows any non-core object, as well as PersistentVolumeClaim objects. \* While dataSource ignores disallowed values (dropping them), dataSourceRef preserves all values, and generates an error if a disallowed value is specified. \* While dataSource only allows local objects, dataSourceRef allows objects in any namespaces. (Beta) Using this field requires the AnyVolumeDataSource feature gate to be enabled. (Alpha) Using the namespace field of dataSourceRef requires the CrossNamespaceVolumeDataSource feature gate to be enabled.

## Type

object

## Required

kind

name

Property	Type	Description
apiGroup	string	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Property	Type	Description
<code>kind</code>	<code>string</code>	Kind is the type of resource being referenced
<code>name</code>	<code>string</code>	Name is the name of resource being referenced
<code>namespace</code>	<code>string</code>	<p>Namespace is the namespace of resource being referenced</p> <p>Note that when a namespace is specified, a <code>gateway.networking.k8s.io/ReferenceGrant</code> object is required in the referent namespace to allow that namespace's owner to accept the reference. See the ReferenceGrant documentation for details. (Alpha) This field requires the <code>CrossNamespaceVolumeDataSource</code> feature gate to be enabled.</p>

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.resources`

### Description

`resources` represents the minimum resources the volume should have. If `RecoverVolumeExpansionFailure` feature is enabled users are allowed to specify resource requirements that are lower than previous value but must still be higher than capacity recorded in the status field of the claim. More info: <https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources>

### Type

`object`

Property	Type	Description
limits	object	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>
requests	object	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a>

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.resources.limits`

### Description

Limits describes the maximum amount of compute resources allowed. More info: <https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/>

### Type

object

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.resources.requests`

### Description

Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an

implementation-defined value. Requests cannot exceed Limits. More info:  
<https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/>

## Type

object

# .spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector

## Description

selector is a label query over volumes to consider for binding.

## Type

object

Property	Type	Description
<code>matchExpressions</code>	array	matchExpressions is a list of label selector requirements. The requirements are ANDed.
<code>matchLabels</code>	object	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

# .spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector.matchExpressions

## Description

matchExpressions is a list of label selector requirements. The requirements are ANDed.

## Type

array

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector.matchExpressions[]`

### Description

A label selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

### Type

object

### Required

key

operator

Property	Type	Description
key	string	key is the label key that the selector applies to.
operator	string	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	array	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

## `.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector.matchExpressions[].values`

### Description

values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

#### Type

array

### **.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector.matchExpressions[].values[]**

#### Type

string

### **.spec.podTemplate.extraVolumes[].ephemeral.volumeClaimTemplate.spec.selector.matchLabels**

#### Description

matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

#### Type

object

### **.spec.podTemplate.extraVolumes[].fc**

#### Description

fc represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.

#### Type

object

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	integer	lun is Optional: FC target lun number
readOnly	boolean	readOnly is Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	array	targetWWNs is Optional: FC target worldwide names (WWNs)
wwids	array	wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

## **.spec.podTemplate.extraVolumes[].fc.targetWWNs**

### **Description**

targetWWNs is Optional: FC target worldwide names (WWNs)

### **Type**

array

## **.spec.podTemplate.extraVolumes[].fc.targetWWNs[]**

### **Type**

string

## `.spec.podTemplate.extraVolumes[].fc.wwids`

### Description

wwids Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

### Type

array

## `.spec.podTemplate.extraVolumes[].fc.wwids[]`

### Type

string

## `.spec.podTemplate.extraVolumes[].flexVolume`

### Description

flexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.

### Type

object

### Required

driver

Property	Type	Description
driver	string	driver is the name of the driver to use for this volume.
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs",

Property	Type	Description
		"ntfs". The default filesystem depends on FlexVolume script.
options	object	options is Optional: this field holds extra command options if any.
readOnly	boolean	readOnly is Optional: defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	secretRef is Optional: secretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

## **.spec.podTemplate.extraVolumes[].flexVolume.options**

### **Description**

options is Optional: this field holds extra command options if any.

### **Type**

object

## **.spec.podTemplate.extraVolumes[].flexVolume.secretRef**

### **Description**

secretRef is Optional: secretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

## Type

object

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## .spec.podTemplate.extraVolumes[].flocker

### Description

flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running

### Type

object

Property	Type	Description
datasetName	string	datasetName is Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	string	datasetUUID is the UUID of the dataset. This is unique identifier of a Flocker dataset

## .spec.podTemplate.extraVolumes[].gcePersistentDisk

## Description

gcePersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info:

<https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk>

## Type

object

## Required

pdName

Property	Type	Description
fsType	string	fsType is filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	integer	partition is the partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	string	pdName is unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Property	Type	Description
readOnly	boolean	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistent">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistent</a>

## .spec.podTemplate.extraVolumes[].gitRepo

### Description

gitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.

### Type

object

### Required

repository

Property	Type	Description
directory	string	directory is the target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	string	repository is the URL
revision	string	revision is the commit hash for the specified revision.

## .spec.podTemplate.extraVolumes[].glusterfs

### Description

glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <https://examples.k8s.io/volumes/glusterfs/README.md>

### Type

object

### Required

endpoints

path

Property	Type	Description
endpoints	string	endpoints is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	string	path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	boolean	readOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

## .spec.podTemplate.extraVolumes[].hostPath

### Description

hostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <https://kubernetes.io/docs/concepts/storage/volumes#hostpath>

## Type

object

## Required

path

Property	Type	Description
path	string	path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	string	type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

## .spec.podTemplate.extraVolumes[].image

### Description

image represents an OCI object (a container image or artifact) pulled and mounted on the kubelet's host machine. The volume is resolved at pod startup depending on which PullPolicy value is provided: - Always: the kubelet always attempts to pull the reference. Container creation will fail if the pull fails. - Never: the kubelet never pulls the reference and only uses a local image or artifact. Container creation will fail if the reference isn't present. - IfNotPresent: the kubelet pulls if the reference isn't already present on disk. Container creation will fail if the reference isn't present and the pull fails. The volume gets re-resolved if the pod gets deleted and recreated, which means that new remote content will become available on pod recreation. A failure to resolve or pull the image during pod startup will block containers from starting and may add significant latency. Failures will be retried using normal volume backoff and will be reported on the pod reason and message. The types of

objects that may be mounted by this volume are defined by the container runtime implementation on a host machine and at minimum must include all valid types supported by the container image field. The OCI object gets mounted in a single directory (`spec.containers[*].volumeMounts.mountPath`) by merging the manifest layers in the same way as for container images. The volume will be mounted read-only (ro) and non-executable files (noexec). Sub path mounts for containers are not supported (`spec.containers[*].volumeMounts.subpath`). The field `spec.securityContext.fsGroupChangePolicy` has no effect on this volume type.

## Type

object

Property	Type	Description
<code>pullPolicy</code>	<code>string</code>	Policy for pulling OCI objects. Possible values are: Always: the kubelet always attempts to pull the reference. Container creation will fail if the pull fails. Never: the kubelet never pulls the reference and only uses a local image or artifact. IfNotPresent: the kubelet pulls if the reference isn't already present on disk. Container creation will fail if the reference isn't present and the pull fails. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise.
<code>reference</code>	<code>string</code>	Required: Image or artifact reference to be used. Behaves in the same way as <code>pod.spec.containers[*].image</code> . Pull secrets will be assembled in the same way as for the container image by looking up node credentials, SA image pull secrets, and pod spec image pull secrets. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.

# .spec.podTemplate.extraVolumes[].iscsi

## Description

iscsi represents an iSCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <https://examples.k8s.io/volumes/iscsi/README.md>

## Type

object

## Required

iqn

lun

targetPortal

Property	Type	Description
<code>chapAuthDiscovery</code>	<code>boolean</code>	chapAuthDiscovery defines whether support iSCSI Discovery CHAP authentication
<code>chapAuthSession</code>	<code>boolean</code>	chapAuthSession defines whether support iSCSI Session CHAP authentication
<code>fsType</code>	<code>string</code>	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>

Property	Type	Description
<code>initiatorName</code>	<code>string</code>	<code>initiatorName</code> is the custom iSCSI Initiator Name. If <code>initiatorName</code> is specified with <code>iscsiInterface</code> simultaneously, new iSCSI interface : will be created for the connection.
<code>iqn</code>	<code>string</code>	<code>iqn</code> is the target iSCSI Qualified Name.
<code>iscsiInterface</code>	<code>string</code>	<code>iscsiInterface</code> is the interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
<code>lun</code>	<code>integer</code>	<code>lun</code> represents iSCSI Target Lun number.
<code>portals</code>	<code>array</code>	<code>portals</code> is the iSCSI Target Portal List. The portal is either an IP or <code>ip_addr:port</code> if the port is other than default (typically TCP ports 860 and 3260).
<code>readOnly</code>	<code>boolean</code>	<code>readOnly</code> here will force the <code>ReadOnly</code> setting in <code>VolumeMounts</code> . Defaults to false.
<code>secretRef</code>	<code>object</code>	<code>secretRef</code> is the CHAP Secret for iSCSI target and initiator authentication

Property	Type	Description
<code>targetPortal</code>	<code>string</code>	targetPortal is iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

## `.spec.podTemplate.extraVolumes[].iscsi.portals`

### Description

portals is the iSCSI Target Portal List. The portal is either an IP or ip\_addr:port if the port is other than default (typically TCP ports 860 and 3260).

### Type

`array`

## `.spec.podTemplate.extraVolumes[].iscsi.portals[]`

### Type

`string`

## `.spec.podTemplate.extraVolumes[].iscsi.secretRef`

### Description

secretRef is the CHAP Secret for iSCSI target and initiator authentication

### Type

`object`

Property	Type	Description
<code>name</code>	<code>string</code>	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More

Property	Type	Description
		info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a> ↗

## `.spec.podTemplate.extraVolumes[].nfs`

### Description

nfs represents an NFS mount on the host that shares a pod's lifetime More info: <https://kubernetes.io/docs/concepts/storage/volumes#nfs>

### Type

object

### Required

path

server

Property	Type	Description
path	string	path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a> ↗
readOnly	boolean	readOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a> ↗
server	string	server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a> ↗

## `.spec.podTemplate.extraVolumes[].persistentVolumeClaim`

## Description

persistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims>

## Type

object

## Required

claimName

Property	Type	Description
claimName	string	claimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	boolean	readOnly Will force the ReadOnly setting in VolumeMounts. Default false.

## .spec.podTemplate.extraVolumes[].photonPersistentDisk

## Description

photonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

## Type

object

## Required

pdID

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	string	pdID is the ID that identifies Photon Controller persistent disk

## .spec.podTemplate.extraVolumes[].portworxVolume

### Description

portworxVolume represents a portworx volume attached and mounted on kubelets host machine

### Type

object

### Required

volumeID

Property	Type	Description
fsType	string	fSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	boolean	readOnly defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

Property	Type	Description
volumeID	string	volumeID uniquely identifies a Portworx volume

## `.spec.podTemplate.extraVolumes[].projected`

### Description

projected items for all in one resources secrets, configmaps, and downward API

### Type

object

Property	Type	Description
defaultMode	integer	defaultMode are the mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	array	sources is the list of volume projections. Each entry in this list handles one source.

## `.spec.podTemplate.extraVolumes[].projected.sources`

### Description

sources is the list of volume projections. Each entry in this list handles one source.

### Type

array

## .spec.podTemplate.extraVolumes[].projected.sources[]

### Description

Projection that may be projected along with other supported volume types. Exactly one of these fields must be set.

### Type

object

Property	Type	Description
<code>clusterTrustBundle</code>	object	<p>ClusterTrustBundle allows a pod to access the <code>.spec.trustBundle</code> field of ClusterTrustBundle objects in an auto-updating file.</p> <p>Alpha, gated by the ClusterTrustBundleProjection feature gate.</p> <p>ClusterTrustBundle objects can either be selected by name, or by the combination of signer name and a label selector.</p> <p>Kubelet performs aggressive normalization of the PEM contents written into the pod filesystem. Esoteric PEM features such as inter-block comments and block headers are stripped. Certificates are deduplicated. The ordering of certificates within the file is arbitrary, and Kubelet may change the order over time.</p>
<code>configMap</code>	object	configMap information about the configMap data to project

Property	Type	Description
<code>downwardAPI</code>	<code>object</code>	downwardAPI information about the downwardAPI data to project
<code>secret</code>	<code>object</code>	secret information about the secret data to project
<code>serviceAccountToken</code>	<code>object</code>	serviceAccountToken is information about the serviceAccountToken data to project

## `.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle`

### Description

ClusterTrustBundle allows a pod to access the `.spec.trustBundle` field of ClusterTrustBundle objects in an auto-updating file. Alpha, gated by the ClusterTrustBundleProjection feature gate. ClusterTrustBundle objects can either be selected by name, or by the combination of signer name and a label selector. Kubelet performs aggressive normalization of the PEM contents written into the pod filesystem. Esoteric PEM features such as inter-block comments and block headers are stripped. Certificates are deduplicated. The ordering of certificates within the file is arbitrary, and Kubelet may change the order over time.`

### Type

`object`

### Required

`path`

Property	Type	Description
<code>labelSelector</code>	<code>object</code>	Select all ClusterTrustBundles that match this label selector. Only has effect if signerName is set. Mutually-exclusive with name. If unset, interpreted as "match nothing". If set but empty, interpreted as "match everything".
<code>name</code>	<code>string</code>	Select a single ClusterTrustBundle by object name. Mutually-exclusive with signerName and labelSelector.
<code>optional</code>	<code>boolean</code>	If true, don't block pod startup if the referenced ClusterTrustBundle(s) aren't available. If using name, then the named ClusterTrustBundle is allowed not to exist. If using signerName, then the combination of signerName and labelSelector is allowed to match zero ClusterTrustBundles.
<code>path</code>	<code>string</code>	Relative path from the volume root to write the bundle.
<code>signerName</code>	<code>string</code>	Select all ClusterTrustBundles that match this signer name. Mutually-exclusive with name. The contents of all selected ClusterTrustBundles will be unified and deduplicated.

## `.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector`

### Description

Select all ClusterTrustBundles that match this label selector. Only has effect if signerName is set. Mutually-exclusive with name. If unset, interpreted as "match nothing". If set but empty, interpreted as "match everything".

## Type

object

Property	Type	Description
matchExpressions	array	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	object	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

## `.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector.matchExpressions`

### Description

matchExpressions is a list of label selector requirements. The requirements are ANDed.

### Type

array

## `.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector.matchExpressions[]`

### Description

A label selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

## Type

object

## Required

key

operator

Property	Type	Description
key	string	key is the label key that the selector applies to.
operator	string	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	array	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**`.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector.matchExpressions[].values`**

## Description

values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

## Type

array

**`.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector.matchExpressions[].values[`**

]

**Type**

string

**.spec.podTemplate.extraVolumes[].projected.sources[].clusterTrustBundle.labelSelector.matchLabels****Description**

matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Type**

object

**.spec.podTemplate.extraVolumes[].projected.sources[].configMap****Description**

configMap information about the configMap data to project

**Type**

object

Property	Type	Description
items	array	items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	boolean	optional specify whether the ConfigMap or its keys must be defined

## `.spec.podTemplate.extraVolumes[].projected.sources[].configMap.items`

### Description

items if unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

## Type

array

# .spec.podTemplate.extraVolumes[].projected.sources[].configMap.items[]

## Description

Maps a string key to a path within a volume.

## Type

object

## Required

key

path

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

## `.spec.podTemplate.extraVolumes[].projected.sources[].downwardAPI`

### Description

downwardAPI information about the downwardAPI data to project

### Type

object

Property	Type	Description
items	array	Items is a list of DownwardAPIVolume file

## `.spec.podTemplate.extraVolumes[].projected.sources[].downwardAPI.items`

### Description

Items is a list of DownwardAPIVolume file

### Type

array

## `.spec.podTemplate.extraVolumes[].projected.sources[].downwardAPI.items[]`

### Description

DownwardAPIVolumeFile represents information to create the file containing the pod field

### Type

object

### Required

path

Property	Type	Description
<code>fieldRef</code>	<code>object</code>	Required: Selects a field of the pod: only annotations, labels, name, namespace and uid are supported.
<code>mode</code>	<code>integer</code>	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume <code>defaultMode</code> will be used. This might be in conflict with other options that affect the file mode, like <code>fsGroup</code> , and the result can be other mode bits set.
<code>path</code>	<code>string</code>	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the <code>'..'</code> path. Must be utf-8 encoded. The first item of the relative path must not start with <code>'..'</code>
<code>resourceFieldRef</code>	<code>object</code>	Selects a resource of the container: only resources limits and requests ( <code>limits.cpu</code> , <code>limits.memory</code> , <code>requests.cpu</code> and <code>requests.memory</code> ) are currently supported.

## `.spec.podTemplate.extraVolumes[].projected.sources[].downwardAPI.items[].fieldRef`

### Description

Required: Selects a field of the pod: only annotations, labels, name, namespace and uid are supported.

**Type**

object

**Required**

fieldPath

Property	Type	Description
apiVersion	string	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	string	Path of the field to select in the specified API version.

## **.spec.podTemplate.extraVolumes[].projected.sources[].downwardAPI.items[].resourceFieldRef**

**Description**

Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Type**

object

**Required**

resource

Property	Type	Description
containerName	string	Container name: required for volumes, optional for env vars

Property	Type	Description
<code>divisor</code>		Specifies the output format of the exposed resources, defaults to "1"
<code>resource</code>	<code>string</code>	Required: resource to select

## `.spec.podTemplate.extraVolumes[].projected.sources[].secret`

### Description

secret information about the secret data to project

### Type

`object`

Property	Type	Description
<code>items</code>	<code>array</code>	items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'
<code>name</code>	<code>string</code>	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info:

Property	Type	Description
		<a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a> ↗
<code>optional</code>	<code>boolean</code>	optional field specify whether the Secret or its key must be defined

## `.spec.podTemplate.extraVolumes[].projected.sources[].secret.items`

### Description

items if unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

### Type

`array`

## `.spec.podTemplate.extraVolumes[].projected.sources[].secret.items[]`

### Description

Maps a string key to a path within a volume.

### Type

`object`

### Required

`key`

`path`

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

## `.spec.podTemplate.extraVolumes[].projected.sources[].serviceAccountToken`

### Description

serviceAccountToken is information about the serviceAccountToken data to project

### Type

object

### Required

path

Property	Type	Description
<code>audience</code>	<code>string</code>	audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
<code>expirationSeconds</code>	<code>integer</code>	expirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
<code>path</code>	<code>string</code>	path is the path relative to the mount point of the file to project the token into.

## `.spec.podTemplate.extraVolumes[].quobyte`

### Description

quobyte represents a Quobyte mount on the host that shares a pod's lifetime

### Type

`object`

### Required

`registry`

`volume`

Property	Type	Description
group	string	group to map volume access to Default is no group
readOnly	boolean	readOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	string	registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	string	tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	string	user to map volume access to Defaults to serviceaccount user
volume	string	volume is a string that references an already created Quobyte volume by name.

## .spec.podTemplate.extraVolumes[].rbd

### Description

rbd represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <https://examples.k8s.io/volumes/rbd/README.md>

### Type

object

**Required**

image

monitors

Property	Type	Description
fsType	string	fsType is the filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	string	image is the rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	string	keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	array	monitors is a collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
pool	string	pool is the rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Property	Type	Description
<code>readOnly</code>	<code>boolean</code>	readOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<code>secretRef</code>	<code>object</code>	secretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
<code>user</code>	<code>string</code>	user is the rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

## `.spec.podTemplate.extraVolumes[].rbd.monitors`

### Description

monitors is a collection of Ceph monitors. More info: <https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it>

### Type

`array`

## `.spec.podTemplate.extraVolumes[].rbd.monitors[]`

### Type

`string`

## .spec.podTemplate.extraVolumes[].rbd.secretRef

### Description

secretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it>

### Type

object

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## .spec.podTemplate.extraVolumes[].scaleIO

### Description

scaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.

### Type

object

### Required

gateway

secretRef

system

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	string	gateway is the host address of the ScaleIO API Gateway.
protectionDomain	string	protectionDomain is the name of the ScaleIO Protection Domain for the configured storage.
readOnly	boolean	readOnly Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	object	secretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	boolean	sslEnabled Flag enable/disable SSL communication with Gateway, default false
storageMode	string	storageMode indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.

Property	Type	Description
storagePool	string	storagePool is the ScaleIO Storage Pool associated with the protection domain.
system	string	system is the name of the storage system as configured in ScaleIO.
volumeName	string	volumeName is the name of a volume already created in the ScaleIO system that is associated with this volume source.

## `.spec.podTemplate.extraVolumes[].scaleIO.secretRef`

### Description

secretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.

### Type

object

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## `.spec.podTemplate.extraVolumes[].secret`

## Description

secret represents a secret that should populate this volume. More info:

<https://kubernetes.io/docs/concepts/storage/volumes#secret>

## Type

object

Property	Type	Description
defaultMode	integer	defaultMode is Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	array	items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	boolean	optional field specify whether the Secret or its keys must be defined

Property	Type	Description
secretName	string	secretName is the name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

## `.spec.podTemplate.extraVolumes[].secret.items`

### Description

items If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

### Type

array

## `.spec.podTemplate.extraVolumes[].secret.items[]`

### Description

Maps a string key to a path within a volume.

### Type

object

### Required

key

path

Property	Type	Description
key	string	key is the key to project.
mode	integer	mode is Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	string	path is the relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

## .spec.podTemplate.extraVolumes[].storageos

### Description

storageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.

### Type

object

Property	Type	Description
fsType	string	fsType is the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Property	Type	Description
<code>readOnly</code>	<code>boolean</code>	<code>readOnly</code> defaults to false (read/write). <code>ReadOnly</code> here will force the <code>ReadOnly</code> setting in <code>VolumeMounts</code> .
<code>secretRef</code>	<code>object</code>	<code>secretRef</code> specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
<code>volumeName</code>	<code>string</code>	<code>volumeName</code> is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
<code>volumeNamespace</code>	<code>string</code>	<code>volumeNamespace</code> specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set <code>VolumeName</code> to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

## `.spec.podTemplate.extraVolumes[].storageos.secretRef`

### Description

`secretRef` specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.

### Type

`object`

Property	Type	Description
name	string	Name of the referent. This field is effectively required, but due to backwards compatibility is allowed to be empty. Instances of this type with an empty value here are almost certainly wrong. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

## .spec.podTemplate.extraVolumes[].vsphereVolume

### Description

vsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

### Type

object

### Required

volumePath

Property	Type	Description
fsType	string	fsType is filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	string	storagePolicyID is the storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.

Property	Type	Description
<code>storagePolicyName</code>	<code>string</code>	storagePolicyName is the storage Policy Based Management (SPBM) profile name.
<code>volumePath</code>	<code>string</code>	volumePath is the path that identifies vSphere volume vmdk

## .spec.podTemplate.httpProxy

### Description

http proxy configs (MUTABLE)

### Type

`object`

Property	Type	Description
<code>removePathPrefix</code>	<code>boolean</code>	<p>if the path prefix is stripped from incoming HTTP requests</p> <ul style="list-style-type: none"> <li>if true, the <code>'/workspace/{profile_name}/{workspace_name}</code> path prefix is stripped from incoming requests, the application sees the request as if it was made to <code>'/...'</code></li> <li>this only works if the application serves RELATIVE URLs its assets</li> </ul>
<code>requestHeaders</code>	<code>object</code>	<p>header manipulation rules for incoming HTTP requests</p> <ul style="list-style-type: none"> <li>sets the <code>spec.http[].headers.request</code> of the Istio VirtualService</li> </ul> <p><a href="https://istio.io/latest/docs/reference/config/networking/virtualservice/#Headers-HeaderOperations">https://istio.io/latest/docs/reference/config/networking/virtualservice/#Headers-HeaderOperations</a></p>

Property	Type	Description
		<ul style="list-style-type: none"> <li>the following string templates are available: <ul style="list-style-type: none"> <li><code>.PathPrefix</code>: the path prefix of the Workspace (e.g. <code>'/workspace/{profile_name}/{workspace_name}'</code>)</li> </ul> </li> </ul>

## `.spec.podTemplate.httpProxy.requestHeaders`

### Description

header manipulation rules for incoming HTTP requests - sets the

``spec.http[].headers.request`` of the Istio VirtualService

<https://istio.io/latest/docs/reference/config/networking/virtual-service/#Headers-HeaderOperations> - the following string templates are available: - `.PathPrefix`: the path

prefix of the Workspace (e.g. `'/workspace/{profile_name}/{workspace_name}'`)

### Type

object

Property	Type	Description
<code>add</code>	object	append the given values to the headers specified by keys (will create a comma-separated list of values)
<code>remove</code>	array	remove the specified headers
<code>set</code>	object	overwrite the headers specified by key with the given values

## `.spec.podTemplate.httpProxy.requestHeaders.add`

### Description

append the given values to the headers specified by keys (will create a comma-separated list of values)

### Type

object

## **.spec.podTemplate.httpProxy.requestHeaders.remove**

### Description

remove the specified headers

### Type

array

## **.spec.podTemplate.httpProxy.requestHeaders.remove[]**

### Type

string

## **.spec.podTemplate.httpProxy.requestHeaders.set**

### Description

overwrite the headers specified by key with the given values

### Type

object

## **.spec.podTemplate.options**

### Description

options are the user-selectable fields, they determine the PodSpec of the Workspace

### Type

object

### Required

imageConfig

podConfig

Property	Type	Description
imageConfig	object	imageConfig options
podConfig	object	podConfig options

## .spec.podTemplate.options.imageConfig

### Description

imageConfig options

### Type

object

### Required

spawner

values

Property	Type	Description
spawner	object	spawner ui configs
values	array	the list of image configs that are available

## .spec.podTemplate.options.imageConfig.spawner

### Description

spawner ui configs

### Type

object

**Required**

default

Property	Type	Description
default	string	<p>the id of the default option</p> <ul style="list-style-type: none"> <li>this will be selected by default in the spawner ui</li> </ul>

**.spec.podTemplate.options.imageConfig.values****Description**

the list of image configs that are available

**Type**

array

**.spec.podTemplate.options.imageConfig.values[]****Type**

object

**Required**

id

spawner

spec

Property	Type	Description
id	string	the id of this image config
redirect	object	redirect configs

Property	Type	Description
spawner	object	information for the spawner ui
spec	object	the spec of the image config

## `.spec.podTemplate.options.imageConfig.values[].redirect`

### Description

redirect configs

### Type

object

### Required

to

Property	Type	Description
message	object	information about the redirect
to	string	the id of the option to redirect to

## `.spec.podTemplate.options.imageConfig.values[].redirect.message`

### Description

information about the redirect

### Type

object

**Required**

level

text

Property	Type	Description
level	string	the importance level of the message
text	string	the text of the message to show

**.spec.podTemplate.options.imageConfig.values[].spawner****Description**

information for the spawner ui

**Type**

object

**Required**

displayName

Property	Type	Description
description	string	a description of the option
displayName	string	the display name of the option
hidden	boolean	if this option should be hidden from the Workspace Spawner UI

Property	Type	Description
labels	array	labels for the option

## `.spec.podTemplate.options.imageConfig.values[].spawner.labels`

### Description

labels for the option

### Type

array

## `.spec.podTemplate.options.imageConfig.values[].spawner.labels[]`

### Type

object

### Required

key value

Property	Type	Description
key	string	the key of the label
value	string	the value of the label

## `.spec.podTemplate.options.imageConfig.values[].spec`

## Description

the spec of the image config

## Type

object

## Required

image

ports

Property	Type	Description
image	string	the container image to use
imagePullPolicy	string	the pull policy for the container image
ports	array	<p>ports that the container listens on</p> <ul style="list-style-type: none"> <li>if multiple ports are defined, the user will see multiple "Connect" buttons in a dropdown menu on the Workspace overview page</li> </ul>

## `.spec.podTemplate.options.imageConfig.values[].spec.ports`

## Description

ports that the container listens on - if multiple ports are defined, the user will see multiple "Connect" buttons in a dropdown menu on the Workspace overview page

## Type

array

## `.spec.podTemplate.options.imageConfig.values[].spec.ports[]`

### Type

object

### Required

displayName id port protocol

Property	Type	Description
displayName	string	the display name of the port
id	string	the id of the port <ul style="list-style-type: none"><li>this is NOT used as the Container or Service port name, but as part of the HTTP path</li></ul>
port	integer	the port number
protocol	string	the protocol of the port

## `.spec.podTemplate.options.podConfig`

### Description

podConfig options

### Type

object

### Required

spawner

values

Property	Type	Description
spawner	object	spawner ui configs
values	array	the list of pod configs that are available

## `.spec.podTemplate.options.podConfig.spawner`

### Description

spawner ui configs

### Type

object

### Required

default

Property	Type	Description
default	string	<p>the id of the default option</p> <ul style="list-style-type: none"> <li>this will be selected by default in the spawner ui</li> </ul>

## `.spec.podTemplate.options.podConfig.values`

### Description

the list of pod configs that are available

### Type

array

## .spec.podTemplate.options.podConfig.values[]

### Type

object

### Required

id

spawner

spec

Property	Type	Description
id	string	the id of this pod config
redirect	object	redirect configs
spawner	object	information for the spawner ui
spec	object	the spec of the pod config

## .spec.podTemplate.options.podConfig.values[].redirect

### Description

redirect configs

### Type

object

### Required

to

Property	Type	Description
message	object	information about the redirect
to	string	the id of the option to redirect to

## `.spec.podTemplate.options.podConfig.values[].redirect.message`

### Description

information about the redirect

### Type

object

### Required

level text

Property	Type	Description
level	string	the importance level of the message
text	string	the text of the message to show

## `.spec.podTemplate.options.podConfig.values[].spawner`

### Description

information for the spawner ui

### Type

object

**Required**

displayName

Property	Type	Description
description	string	a description of the option
displayName	string	the display name of the option
hidden	boolean	if this option should be hidden from the Workspace Spawner UI
labels	array	labels for the option

**.spec.podTemplate.options.podConfig.values[].spawner.labels****Description**

labels for the option

**Type**

array

**.spec.podTemplate.options.podConfig.values[].spawner.labels[]****Type**

object

**Required**

key

value

Property	Type	Description
key	string	the key of the label
value	string	the value of the label

**.spec.podTemplate.options.podConfig.values[].spec****Description**

the spec of the pod config

**Type**

object

Property	Type	Description
affinity	object	affinity configs for the pod
nodeSelector	object	node selector configs for the pod
resources	object	resource configs for the "main" container in the pod
tolerations	array	toleration configs for the pod

# .spec.podTemplate.options.podConfig.values[].spec.affinity

## Description

affinity configs for the pod

## Type

object

Property	Type	Description
<code>nodeAffinity</code>	object	Describes node affinity scheduling rules for the pod.
<code>podAffinity</code>	object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
<code>podAntiAffinity</code>	object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

# .spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity

## Description

Describes node affinity scheduling rules for the pod.

## Type

object

Property	Type	Description
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	<code>array</code>	<p>The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code> affinity expressions, etc.) compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding <code>matchExpressions</code>; the node(s) with the highest sum are the most preferred.</p>
<code>requiredDuringSchedulingIgnoredDuringExecution</code>	<code>object</code>	<p>If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node.</p>

Property	Type	Description
		If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution`

### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[]`

### Description

An empty preferred scheduling term matches all objects with implicit weight 0 (i.e. it's a no-op). A null preferred scheduling term matches no objects (i.e. is also a no-op).

## Type

object

## Required

preference

weight

Property	Type	Description
preference	object	A node selector term, associated with the corresponding weight.
weight	integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference`

## Description

A node selector term, associated with the corresponding weight.

## Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.

Property	Type	Description
<code>matchFields</code>	<code>array</code>	A list of node selector requirements by node's fields.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchExpressions`

### Description

A list of node selector requirements by node's labels.

### Type

`array`

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchExpressions[]`

### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

### Type

`object`

### Required

`key`

`operator`

Property	Type	Description
<code>key</code>	<code>string</code>	The label key that the selector applies to.

Property	Type	Description
<code>operator</code>	<code>string</code>	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
<code>values</code>	<code>array</code>	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchExpressions[].values`

### Description

An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### Type

`array`

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchExpressions[].values[]`

### Type

`string`

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchFields`

### Description

A list of node selector requirements by node's fields.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchFields[]`

### Description

A node selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

### Type

object

### Required

key

operator

Property	Type	Description
key	string	The label key that the selector applies to.
operator	string	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Property	Type	Description
values	array	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

## **.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchFields[].values**

### Description

An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

### Type

array

## **.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.preferredDuringSchedulingIgnoredDuringExecution[].preference.matchFields[].values[]**

### Type

string

## **.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringEx**

# ecution

## Description

If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

## Type

object

## Required

nodeSelectorTerms

Property	Type	Description
nodeSelectorTerms	array	Required. A list of node selector terms. The terms are ORed.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms`

## Description

Required. A list of node selector terms. The terms are ORed.

## Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms[]`

## Description

A null or empty node selector term matches no objects. The requirements of them are ANDed. The TopologySelectorTerm type implements a subset of the NodeSelectorTerm.

## Type

object

Property	Type	Description
matchExpressions	array	A list of node selector requirements by node's labels.
matchFields	array	A list of node selector requirements by node's fields.

**.spec.podTemplate.options.podConfig.values[].spec.affinity.nodeAffinity.requiredDuringSchedulingIgnoredDuringExecution.nodeSelectorTerms[].matchExpressions**

## Description

A list of node selector requirements by node's labels.

## Type

array

When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.</p>

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution`

### Description

The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, `requiredDuringScheduling` affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding `podAffinityTerm`; the node(s) with the highest sum are the most preferred.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution[]`

### Description

The weights of all of the matched `WeightedPodAffinityTerm` fields are added per-node to find the most preferred node(s)

### Type

object

### Required

`podAffinityTerm`

`weight`

Property	Type	Description
<code>podAffinityTerm</code>	<code>object</code>	Required. A pod affinity term, associated with the corresponding weight.
<code>weight</code>	<code>integer</code>	weight associated with matching the corresponding <code>podAffinityTerm</code> , in the range 1-100.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm`

### Description

Required. A pod affinity term, associated with the corresponding weight.

### Type

`object`

### Required

`topologyKey`

Property	Type	Description
<code>labelSelector</code>	<code>object</code>	A label query over a set of resources, in this case pods. If it's null, this <code>PodAffinityTerm</code> matches with no Pods.
<code>matchLabelKeys</code>	<code>array</code>	<code>MatchLabelKeys</code> is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with

Property	Type	Description
		<p><code>labelSelector</code> as <code>key in (value)</code> to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti) affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both <code>matchLabelKeys</code> and <code>labelSelector</code>. Also, <code>matchLabelKeys</code> cannot be set when <code>labelSelector</code> isn't set. This is a beta field and requires enabling <code>MatchLabelKeysInPodAffinity</code> feature gate (enabled by default).</p>
<code>mismatchLabelKeys</code>	array	<p><code>MismatchLabelKeys</code> is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with <code>labelSelector</code> as <code>key notin (value)</code> to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti) affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both <code>mismatchLabelKeys</code> and <code>labelSelector</code>. Also, <code>mismatchLabelKeys</code> cannot be set when <code>labelSelector</code> isn't set. This is a beta field and requires enabling <code>MatchLabelKeysInPodAffinity</code> feature gate (enabled by default).</p>
<code>namespaceSelector</code>	object	<p>A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the <code>namespaces</code> field. null selector and null or empty namespaces list means "this pod's</p>

Property	Type	Description
		namespace". An empty selector ({} matches all namespaces.
namespaces	array	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
topologyKey	string	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.labelSelector`

### Description

A label query over a set of resources, in this case pods. If it's null, this PodAffinityTerm matches with no Pods.

### Type

object

Property	Type	Description
<code>matchExpressions</code>	array	<code>matchExpressions</code> is a list of label selector requirements. The requirements are ANDed.
<code>matchLabels</code>	object	<code>matchLabels</code> is a map of {key,value} pairs. A single {key,value} in the <code>matchLabels</code> map is equivalent to an element of <code>matchExpressions</code> , whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

Property	Type	Description
key	string	key is the label key that the selector applies to.
operator	string	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	array	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[].namespaceSelector.matchExpressions[]`

## `cution[].namespaceSelector.matchExpressions[].values`

### Description

values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[].namespaceSelector.matchExpressions[].values[]`

### Type

string

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[].namespaceSelector.matchLabels`

### Description

matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

### Type

object

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[].namespaces`

## Description

namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".

## Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAffinity.requiredDuringSchedulingIgnoredDuringExecution[].namespaces[]`

## Type

string

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity`

## Description

Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

## Type

object

Property	Type	Description
<code>preferredDuringSchedulingIgnoredDuringExecution</code>	array	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node tha

Property	Type	Description
		<p>violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, <code>requiredDuringSchedulingIgnoredDuringExecution</code>, anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding <code>podAffinityTerm</code>; the node(s) with the highest sum are the most preferred.</p>
<p><code>requiredDuringSchedulingIgnoredDuringExecution</code></p>	<p>array</p>	<p>If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a</p>

Property	Type	Description
		pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

## **.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution**

### **Description**

The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

### **Type**

array

## **.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[]**

## Description

The weights of all of the matched WeightedPodAffinityTerm fields are added per-node to find the most preferred node(s)

## Type

object

## Required

podAffinityTerm

weight

Property	Type	Description
podAffinityTerm	object	Required. A pod affinity term, associated with the corresponding weight.
weight	integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm**

## Description

Required. A pod affinity term, associated with the corresponding weight.

## Type

object

## Required

topologyKey

Property	Type	Description
<code>labelSelector</code>	<code>object</code>	A label query over a set of resources, in this case pods. If it's null, this PodAffinityTerm matches with no Pods.
<code>matchLabelKeys</code>	<code>array</code>	MatchLabelKeys is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with <code>labelSelector</code> as <code>key in (value)</code> to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti) affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both matchLabelKeys and labelSelector. Also, matchLabelKeys cannot be set when labelSelector isn't set. This is a beta field and requires enabling MatchLabelKeysInPodAffinity feature gate (enabled by default).
<code>mismatchLabelKeys</code>	<code>array</code>	MismatchLabelKeys is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with <code>labelSelector</code> as <code>key not in (value)</code> to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti) affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both mismatchLabelKeys and labelSelector. Also, mismatchLabelKeys cannot be set when labelSelector isn't set. This is a beta field

Property	Type	Description
		and requires enabling MatchLabelKeysInPodAffinity feature gate (enabled by default).
<code>namespaceSelector</code>	<code>object</code>	A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the namespaces field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector ({} matches all namespaces.
<code>namespaces</code>	<code>array</code>	namespaces specifies a static list of namespace names that the term applies to. The term is applied to the union of the namespaces listed in this field and the ones selected by namespaceSelector. null or empty namespaces list and null namespaceSelector means "this pod's namespace".
<code>topologyKey</code>	<code>string</code>	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**`.spec.podTemplate.options.podConfig.values[].spec.affinity`  
**`.podAntiAffinity.preferredDuringSchedulingIgnoredDurin`****

## gExecution[].podAffinityTerm.labelSelector

### Description

A label query over a set of resources, in this case pods. If it's null, this PodAffinityTerm matches with no Pods.

### Type

object

Property	Type	Description
matchExpressions	array	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	object	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

### Description

matchExpressions is a list of label selector requirements. The requirements are ANDed.

### Type

array

# `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.labelSelector.matchExpressions[]`

## Description

A label selector requirement is a selector that contains values, a key, and an operator that relates the key and values.

## Type

object

## Required

key

operator

Property	Type	Description
key	string	key is the label key that the selector applies to.
operator	string	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	array	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

# `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuring`

## `gExecution[].podAffinityTerm.labelSelector.matchExpressions[].values`

### Description

values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.labelSelector.matchExpressions[].values[]`

### Type

string

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.labelSelector.matchLabels`

### Description

matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

### Type

object

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.matchLabelKeys`

### Description

MatchLabelKeys is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with `labelSelector` as `key in (value)` to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti) affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both matchLabelKeys and labelSelector. Also, matchLabelKeys cannot be set when labelSelector isn't set. This is a beta field and requires enabling MatchLabelKeysInPodAffinity feature gate (enabled by default).

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.matchLabelKeys[]`

### Type

string

## `.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.mismatchLabelKeys`

### Description

MismatchLabelKeys is a set of pod label keys to select which pods will be taken into consideration. The keys are used to lookup values from the incoming pod labels, those key-value labels are merged with `labelSelector` as `key notin (value)` to select the group of existing pods which pods will be taken into consideration for the incoming pod's pod (anti)

affinity. Keys that don't exist in the incoming pod labels will be ignored. The default value is empty. The same key is forbidden to exist in both `mismatchLabelKeys` and `labelSelector`. Also, `mismatchLabelKeys` cannot be set when `labelSelector` isn't set. This is a beta field and requires enabling `MatchLabelKeysInPodAffinity` feature gate (enabled by default).

### Type

array

**`.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.mismatchLabelKeys[]`**

### Type

string

**`.spec.podTemplate.options.podConfig.values[].spec.affinity.podAntiAffinity.preferredDuringSchedulingIgnoredDuringExecution[].podAffinityTerm.namespaceSelector`**

### Description

A label query over the set of namespaces that the term applies to. The term is applied to the union of the namespaces selected by this field and the ones listed in the `namespaces` field. null selector and null or empty namespaces list means "this pod's namespace". An empty selector (`{}`) matches all namespaces.

### Type

object

Property	Type	Description
<code>matchExpressions</code>	array	<code>matchExpressions</code> is a list of label selector requirements. The requirements are ANDed.

Property	Type	Description
<code>matchLabels</code>	<code>object</code>	<code>matchLabels</code> is a map of {key,value} pairs. A single {key,value} in the <code>matchLabels</code> map is equivalent to an element of <code>matchExpressions</code> , whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

object

# .spec.podTemplate.options.podConfig.values[].spec.resources

## Description

resource configs for the "main" container in the pod

## Type

object

Property	Type	Description
		Claims lists the names of resources, defined in spec.resourceClaims, that are used by this container.
claims	array	<p>This is an alpha field and requires enabling the DynamicResourceAllocation feature gate.</p> <p>This field is immutable. It can only be set for containers.</p>
limits	object	<p>Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a></p>
requests	object	<p>Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info:</p>

Property	Type	Description
		<a href="https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/">https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/</a> ↗

## `.spec.podTemplate.options.podConfig.values[].spec.resources.claims`

### Description

Claims lists the names of resources, defined in `spec.resourceClaims`, that are used by this container. This is an alpha field and requires enabling the `DynamicResourceAllocation` feature gate. This field is immutable. It can only be set for containers.

### Type

array

## `.spec.podTemplate.options.podConfig.values[].spec.resources.claims[]`

### Description

ResourceClaim references one entry in `PodSpec.ResourceClaims`.

### Type

object

### Required

name

Property	Type	Description
<code>name</code>	<code>string</code>	Name must match the name of one entry in <code>pod.spec.resourceClaims</code> of the Pod where this field is used. It makes that resource available inside a container.

Property	Type	Description
request	string	Request is the name chosen for a request in the referenced claim. If empty, everything from the claim is made available, otherwise only the result of this request.

## `.spec.podTemplate.options.podConfig.values[].spec.resources.limits`

### Description

Limits describes the maximum amount of compute resources allowed. More info: <https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/>

### Type

object

## `.spec.podTemplate.options.podConfig.values[].spec.resources.requests`

### Description

Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. Requests cannot exceed Limits. More info: <https://kubernetes.io/docs/concepts/configuration/manage-resources-containers/>

### Type

object

## `.spec.podTemplate.options.podConfig.values[].spec.tolerations`

### Description

toleration configs for the pod

## Type

array

# `.spec.podTemplate.options.podConfig.values[].spec.tolerations[]`

## Description

The pod this Toleration is attached to tolerates any taint that matches the triple <key,value,effect> using the matching operator <operator>.

## Type

object

Property	Type	Description
<code>effect</code>	<code>string</code>	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
<code>key</code>	<code>string</code>	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
<code>operator</code>	<code>string</code>	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

Property	Type	Description
<code>tolerationSeconds</code>	<code>integer</code>	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
<code>value</code>	<code>string</code>	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

## `.spec.podTemplate.podMetadata`

### Description

metadata for Workspace Pods (MUTABLE)

### Type

`object`

Property	Type	Description
<code>annotations</code>	<code>object</code>	annotations to be applied to the Pod resource
<code>labels</code>	<code>object</code>	labels to be applied to the Pod resource

## `.spec.podTemplate.podMetadata.annotations`

### Description

annotations to be applied to the Pod resource

### Type

object

## **.spec.podTemplate.podMetadata.labels**

### Description

labels to be applied to the Pod resource

### Type

object

## **.spec.podTemplate.probes**

### Description

standard probes to determine Container health (MUTABLE)

### Type

object

Property	Type	Description
<code>livenessProbe</code>	object	the liveness probe for the main container
<code>readinessProbe</code>	object	the readiness probe for the main container
<code>startupProbe</code>	object	the startup probe for the main container

## **.spec.podTemplate.probes.livenessProbe**

### Description

## the liveness probe for the main container

## Type

object

Property	Type	Description
exec	object	Exec specifies the action to take.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Default value is 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC
httpGet	object	HTTPGet specifies the http request to perform
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/controllers/lifecycle#container-probes</a>
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.

Property	Type	Description
<code>successThreshold</code>	<code>integer</code>	Minimum consecutive successes for the probe to be considered successful after having failed. Default is 1. Must be 1 for liveness and startup. Minimum value is 1.
<code>tcpSocket</code>	<code>object</code>	TCP socket specifies an action involving a TCP port.  Optional duration in seconds the pod needs to gracefully shutdown on probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time until the processes are forcibly halted with a kill signal. A higher value indicates a longer cleanup time.  If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. Value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta feature and requires enabling ProbeTerminationGracePeriod. Minimum value is 1.  spec.terminationGracePeriodSeconds is used when unset.
<code>terminationGracePeriodSeconds</code>	<code>integer</code>	Optional duration in seconds the pod needs to gracefully shutdown on probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time until the processes are forcibly halted with a kill signal. A higher value indicates a longer cleanup time.  If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided by the pod spec. Value must be non-negative integer. Value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta feature and requires enabling ProbeTerminationGracePeriod. Minimum value is 1.  spec.terminationGracePeriodSeconds is used when unset.
<code>timeoutSeconds</code>	<code>integer</code>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. Must be greater than 0. See <a href="https://kubernetes.io/docs/concepts/workloads/controllers/lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/controllers/lifecycle#container-probes</a> for more details.

**.spec.podTemplate.probes.livenessProbe.exec**

## Description

Exec specifies the action to take.

## Type

object

Property	Type	Description
command	array	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

## `.spec.podTemplate.probes.livenessProbe.exec.command`

## Description

Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions ('|', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

## Type

array

## `.spec.podTemplate.probes.livenessProbe.exec.command[ ]`

## Type

string

## .spec.podTemplate.probes.livenessProbe.grpc

### Description

GRPC specifies an action involving a GRPC port.

### Type

object

### Required

port

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	<p>Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ↗).</p> <p>If this is not specified, the default behavior is defined by gRPC.</p>

## .spec.podTemplate.probes.livenessProbe.httpGet

### Description

HTTPGet specifies the http request to perform.

### Type

object

### Required

port

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
path	string	Path to access on the HTTP server.
port		Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP.

## `.spec.podTemplate.probes.livenessProbe.httpGet.httpHeaders`

### Description

Custom headers to set in the request. HTTP allows repeated headers.

### Type

array

## `.spec.podTemplate.probes.livenessProbe.httpGet.httpHeaders[]`

## Description

HTTPHeader describes a custom header to be used in HTTP probes

## Type

object

## Required

name

value

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

## .spec.podTemplate.probes.livenessProbe.tcpSocket

## Description

TCPSocket specifies an action involving a TCP port.

## Type

object

## Required

port

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.

Property	Type	Description
port	integer	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

## .spec.podTemplate.probes.readinessProbe

### Description

the readiness probe for the main container

### Type

object

Property	Type	Description
exec	object	Exec specifies the action to take.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Default value is 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC
httpGet	object	HTTPGet specifies the http request to perform
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="#">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#container-probes</a>

Property	Type	Description
		<a href="https://kubernetes.io/docs/concepts/workload-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workload-lifecycle#container-probes</a> ↗
<code>periodSeconds</code>	<code>integer</code>	How often (in seconds) to perform the probe. Minimum value is 10 seconds. Minimum value is 1.
<code>successThreshold</code>	<code>integer</code>	Minimum consecutive successes for the probe to be considered successful after having failed. Default is 1. Must be 1 for liveness and startup. Minimum value is 1.
<code>tcpSocket</code>	<code>object</code>	TCP socket specifies an action involving a TCP port.
<code>terminationGracePeriodSeconds</code>	<code>integer</code>	Optional duration in seconds the pod needs to gracefully terminate upon probe failure. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time until the processes are forcibly halted with a kill signal. A value greater than 0 indicates the grace period should be used. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided in the pod spec. Value must be non-negative integer. Value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta feature and requires enabling ProbeTerminationGracePeriod. Minimum value is 1. Default is nil. spec.terminationGracePeriodSeconds is used.

Property	Type	Description
<code>timeoutSeconds</code>	<code>integer</code>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/replicaset/#liveness-probes">https://kubernetes.io/docs/concepts/workloads/controllers/replicaset/#liveness-probes</a>

## `.spec.podTemplate.probes.readinessProbe.exec`

### Description

Exec specifies the action to take.

### Type

`object`

Property	Type	Description
<code>command</code>	<code>array</code>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

## `.spec.podTemplate.probes.readinessProbe.exec.command`

### Description

Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions ('|', etc) won't work. To use a shell, you

need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

### Type

array

## `.spec.podTemplate.probes.readinessProbe.exec.command[]`

### Type

string

## `.spec.podTemplate.probes.readinessProbe.grpc`

### Description

GRPC specifies an action involving a GRPC port.

### Type

object

### Required

port

Property	Type	Description
<code>port</code>	<code>integer</code>	Port number of the gRPC service. Number must be in the range 1 to 65535.

Property	Type	Description
service	string	<p>Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ↗).</p> <p>If this is not specified, the default behavior is defined by gRPC.</p>

## .spec.podTemplate.probes.readinessProbe.httpGet

### Description

HTTPGet specifies the http request to perform.

### Type

object

### Required

port

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	array	Custom headers to set in the request. HTTP allows repeated headers.
path	string	Path to access on the HTTP server.

Property	Type	Description
port		Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	string	Scheme to use for connecting to the host. Defaults to HTTP.

## `.spec.podTemplate.probes.readinessProbe.httpGet.httpHeaders`

### Description

Custom headers to set in the request. HTTP allows repeated headers.

### Type

array

## `.spec.podTemplate.probes.readinessProbe.httpGet.httpHeaders[]`

### Description

HTTPHeader describes a custom header to be used in HTTP probes

### Type

object

### Required

name

value

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

## `.spec.podTemplate.probes.readinessProbe.tcpSocket`

### Description

TCPSocket specifies an action involving a TCP port.

### Type

object

### Required

port

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port		Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

## `.spec.podTemplate.probes.startupProbe`

### Description

the startup probe for the main container

## Type

object

Property	Type	Description
exec	object	Exec specifies the action to take.
failureThreshold	integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Default value is 3. Minimum value is 1.
grpc	object	GRPC specifies an action involving a GRPC
httpGet	object	HTTPGet specifies the http request to perform
initialDelaySeconds	integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/liveness-probe#container-probes">https://kubernetes.io/docs/concepts/workloads/controllers/liveness-probe#container-probes</a>
periodSeconds	integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	integer	Minimum consecutive successes for the probe to be considered successful after having failed. Default value is 1. Must be 1 for liveness and startup. Minimum value is 1.

Property	Type	Description
<code>tcpSocket</code>	<code>object</code>	TCP Socket specifies an action involving a T
<code>terminationGracePeriodSeconds</code>	<code>integer</code>	Optional duration in seconds the pod needs gracefully upon probe failure. The grace period duration in seconds after the processes running in the pod are sent a termination signal and the timer processes are forcibly halted with a kill signal. A value greater than zero indicates the grace period. If this value is nil, the pod's terminationGracePeriodSeconds will be used. Otherwise, this value overrides the value provided in the pod spec. Value must be non-negative integer. Value zero indicates stop immediately via the kill signal (no opportunity to shut down). This is a beta feature and requires enabling ProbeTerminationGracePeriod. Minimum value is 1. spec.terminationGracePeriodSeconds is used.
<code>timeoutSeconds</code>	<code>integer</code>	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/lifecycle#container-probes</a>

## `.spec.podTemplate.probes.startupProbe.exec`

### Description

Exec specifies the action to take.

### Type

`object`

Property	Type	Description
<code>command</code>	<code>array</code>	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

## `.spec.podTemplate.probes.startupProbe.exec.command`

### Description

Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions ('|', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

### Type

`array`

## `.spec.podTemplate.probes.startupProbe.exec.command[]`

### Type

`string`

## `.spec.podTemplate.probes.startupProbe.grpc`

### Description

GRPC specifies an action involving a GRPC port.

### Type

`object`

**Required**

port

Property	Type	Description
port	integer	Port number of the gRPC service. Number must be in the range 1 to 65535.
service	string	Service is the name of the service to place in the gRPC HealthCheckRequest (see <a href="https://github.com/grpc/grpc/blob/master/doc/health-checking.md">https://github.com/grpc/grpc/blob/master/doc/health-checking.md</a> ↗).  If this is not specified, the default behavior is defined by gRPC.

**.spec.podTemplate.probes.startupProbe.httpGet****Description**

HTTPGet specifies the http request to perform.

**Type**

object

**Required**

port

Property	Type	Description
host	string	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.

Property	Type	Description
<code>httpHeaders</code>	<code>array</code>	Custom headers to set in the request. HTTP allows repeated headers.
<code>path</code>	<code>string</code>	Path to access on the HTTP server.
<code>port</code>		Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
<code>scheme</code>	<code>string</code>	Scheme to use for connecting to the host. Defaults to HTTP.

## `.spec.podTemplate.probes.startupProbe.httpGet.httpHeaders`

### Description

Custom headers to set in the request. HTTP allows repeated headers.

### Type

`array`

## `.spec.podTemplate.probes.startupProbe.httpGet.httpHeaders[]`

### Description

HTTPHeader describes a custom header to be used in HTTP probes

### Type

object

**Required**

name

value

Property	Type	Description
name	string	The header field name. This will be canonicalized upon output, so case-variant names will be understood as the same header.
value	string	The header field value

**.spec.podTemplate.probes.startupProbe.tcpSocket****Description**

TCPsocket specifies an action involving a TCP port.

**Type**

object

**Required**

port

Property	Type	Description
host	string	Optional: Host name to connect to, defaults to the pod IP.
port		Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

# .spec.podTemplate.securityContext

## Description

security context for Workspace Pods (MUTABLE)

## Type

object

Property	Type	Description
<code>appArmorProfile</code>	object	<p>appArmorProfile is the AppArmor options to use by the containers in this pod. Note that this field cannot be set when spec.os.name is windows.</p>
<code>fsGroup</code>	integer	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"><li>1. The owning GID will be the FSGroup</li><li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li><li>3. The permission bits are OR'd with rw-rw--</li></ol> <p>--</p> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume. Note that this field cannot be set when spec.os.name is windows.</p>
<code>fsGroupChangePolicy</code>	string	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod.</p>

Property	Type	Description
		<p>This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified, "Always" is used. Note that this field cannot be set when spec.os.name is windows.</p>
<code>runAsGroup</code>	<code>integer</code>	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.</p>
<code>runAsNonRoot</code>	<code>boolean</code>	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>

Property	Type	Description
<code>runAsUser</code>	<code>integer</code>	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<code>seLinuxOptions</code>	<code>object</code>	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.
<code>seccompProfile</code>	<code>object</code>	The seccomp options to use by the containers in this pod. Note that this field cannot be set when spec.os.name is windows.
<code>supplementalGroups</code>	<code>array</code>	A list of groups applied to the first process run in each container, in addition to the container's primary GID and fsGroup (if specified). If the SupplementalGroupsPolicy

Property	Type	Description
		feature is enabled, the supplementalGroupsPolicy field determines whether these are in addition to or instead of any group memberships defined in the container image. If unspecified, no additional groups are added, though group memberships defined in the container image may still be used, depending on the supplementalGroupsPolicy field. Note that this field cannot be set when spec.os.name is windows.
supplementalGroupsPolicy	string	Defines how supplemental groups of the first container processes are calculated. Valid values are "Merge" and "Strict". If not specified, "Merge" is used. (Alpha) Using the field requires the SupplementalGroupsPolicy feature gate to be enabled and the container runtime must implement support for this feature. Note that this field cannot be set when spec.os.name is windows.
sysctls	array	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when spec.os.name is windows.
windowsOptions	object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If

Property	Type	Description
		set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

## .spec.podTemplate.securityContext.appArmorProfile

### Description

appArmorProfile is the AppArmor options to use by the containers in this pod. Note that this field cannot be set when spec.os.name is windows.

### Type

object

### Required

type

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile loaded on the node that should be used. The profile must be preconfigured on the node to work. Must match the loaded name of the profile. Must be set if and only if type is "Localhost".
type	string	type indicates which kind of AppArmor profile will be applied. Valid options are: Localhost - a profile preloaded on the node. RuntimeDefault - the container runtime's default profile. Unconfined - no AppArmor enforcement.

## .spec.podTemplate.securityContext.seLinuxOptions

### Description

The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container. Note that this field cannot be set when spec.os.name is windows.

### Type

object

Property	Type	Description
level	string	Level is SELinux level label that applies to the container.
role	string	Role is a SELinux role label that applies to the container.
type	string	Type is a SELinux type label that applies to the container.
user	string	User is a SELinux user label that applies to the container.

## .spec.podTemplate.securityContext.seccompProfile

### Description

The seccomp options to use by the containers in this pod. Note that this field cannot be set when spec.os.name is windows.

### Type

object

### Required

type

Property	Type	Description
localhostProfile	string	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must be set if type is "Localhost". Must NOT be set for any other type.
type	string	type indicates which kind of seccomp profile will be applied. Valid options are:  Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

## .spec.podTemplate.securityContext.supplementalGroups

### Description

A list of groups applied to the first process run in each container, in addition to the container's primary GID and fsGroup (if specified). If the SupplementalGroupsPolicy feature is enabled, the supplementalGroupsPolicy field determines whether these are in addition to or instead of any group memberships defined in the container image. If unspecified, no additional groups are added, though group memberships defined in the container image may still be used, depending on the supplementalGroupsPolicy field. Note that this field cannot be set when spec.os.name is windows.

### Type

array

## .spec.podTemplate.securityContext.supplementalGroups[]

### Type

integer

## .spec.podTemplate.securityContext.sysctls

### Description

Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch. Note that this field cannot be set when `spec.os.name` is windows.

### Type

array

## .spec.podTemplate.securityContext.sysctls[]

### Description

Sysctl defines a kernel parameter to be set

### Type

object

### Required

name

value

Property	Type	Description
name	string	Name of a property to set
value	string	Value of a property to set

## .spec.podTemplate.securityContext.windowsOptions

## Description

The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence. Note that this field cannot be set when spec.os.name is linux.

## Type

object

Property	Type	Description
<code>gmsaCredentialSpec</code>	string	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ^) inlines the contents of the GMSA credential spec named by the <code>GMSACredentialSpecName</code> field.
<code>gmsaCredentialSpecName</code>	string	<code>GMSACredentialSpecName</code> is the name of the GMSA credential spec to use.
<code>hostProcess</code>	boolean	<code>HostProcess</code> determines if a container should be run as a 'Host Process' container. All of a Pod's containers must have the same effective <code>HostProcess</code> value (it is not allowed to have a mix of <code>HostProcess</code> containers and non- <code>HostProcess</code> containers). In addition, if <code>HostProcess</code> is true then <code>HostNetwork</code> must also be set to true.
<code>runAsUserName</code>	string	The <code>UserName</code> in Windows to run the entrypoint of the container process. Defaults to

Property	Type	Description
		the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

## .spec.podTemplate.serviceAccount

### Description

service account configs for Workspace Pods

### Type

object

### Required

name

Property	Type	Description
name	string	<p>the name of the ServiceAccount (NOT MUTABLE)</p> <ul style="list-style-type: none"> <li>this Service Account MUST already exist in the Namespace of the Workspace, the controller will NOT create it</li> <li>we will not show this WorkspaceKind in the Spawner UI if the SA does not exist in the Namespace</li> </ul>

## .spec.podTemplate.volumeMounts

### Description

volume mount paths

### Type

`object`**Required**`home`

Property	Type	Description
<code>home</code>	<code>string</code>	the path to mount the home PVC (NOT MUTABLE)

**.spec.spawner****Description**

spawner config determines how the WorkspaceKind is displayed in the Workspace Spawner UI

**Type**`object`**Required**`description``displayName``icon``logo`

Property	Type	Description
<code>deprecated</code>	<code>boolean</code>	if this WorkspaceKind is deprecated
<code>deprecationMessage</code>	<code>string</code>	a message to show in Workspace Spawner UI when the WorkspaceKind is deprecated
<code>description</code>	<code>string</code>	the description of the WorkspaceKind

Property	Type	Description
<code>displayName</code>	<code>string</code>	the display name of the WorkspaceKind
<code>hidden</code>	<code>boolean</code>	if this WorkspaceKind should be hidden from the Workspace Spawner UI
<code>icon</code>	<code>object</code>	<p>the icon of the WorkspaceKind</p> <ul style="list-style-type: none"> <li>a small (favicon-sized) icon used in the Workspace Spawner UI</li> </ul>
<code>logo</code>	<code>object</code>	<p>the logo of the WorkspaceKind</p> <ul style="list-style-type: none"> <li>a 1:1 (card size) logo used in the Workspace Spawner UI</li> </ul>

## `.spec.spawner.icon`

### Description

the icon of the WorkspaceKind - a small (favicon-sized) icon used in the Workspace Spawner UI

### Type

`object`

Property	Type	Description
<code>configMap</code>	<code>object</code>	
<code>url</code>	<code>string</code>	

## .spec.spawner.icon.configMap

### Type

object

### Required

key

name

Property	Type	Description
key	string	
name	string	

## .spec.spawner.logo

### Description

the logo of the WorkspaceKind - a 1:1 (card size) logo used in the Workspace Spawner UI

### Type

object

Property	Type	Description
configMap	object	
url	string	

## .spec.spawner.logo.configMap

### Type

object

### Required

key

name

Property	Type	Description
key	string	
name	string	

## .status

### Description

WorkspaceKindStatus defines the observed state of WorkspaceKind

### Type

object

### Required

podTemplateOptions

workspaces

Property	Type	Description
podTemplateOptions	object	metrics for podTemplate options
workspaces	integer	the number of Workspaces that are using this WorkspaceKind

## .status.podTemplateOptions

### Description

metrics for podTemplate options

### Type

object

### Required

imageConfig

podConfig

Property	Type	Description
<code>imageConfig</code>	<code>array</code>	metrics about the imageConfig options
<code>podConfig</code>	<code>array</code>	metrics about the podConfig options

## `.status.podTemplateOptions.imageConfig`

### Description

metrics about the imageConfig options

### Type

`array`

## `.status.podTemplateOptions.imageConfig[]`

### Type

`object`

### Required

`id` `workspaces`

Property	Type	Description
<code>id</code>	<code>string</code>	the id of the option
<code>workspaces</code>	<code>integer</code>	the number of Workspaces currently using the option

## `.status.podTemplateOptions.podConfig`

## Description

metrics about the podConfig options

## Type

array

## .status.podTemplateOptions.podConfig[]

## Type

object

## Required

id workspaces

Property	Type	Description
id	string	the id of the option
workspaces	integer	the number of Workspaces currently using the option

## API Endpoints

The following API endpoints are available:

- `/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspacekinds`
  - **DELETE** : delete collection of WorkspaceKind
  - **GET** : list objects of kind WorkspaceKind
  - **POST** : create a new WorkspaceKind
- `/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspacekinds/{name}`
  - **DELETE** : delete the specified WorkspaceKind

- **GET** : read the specified WorkspaceKind
- **PATCH** : partially update the specified WorkspaceKind
- **PUT** : replace the specified WorkspaceKind
- **/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspacekinds/{name}/status**
  - **GET** : read status of the specified WorkspaceKind
  - **PATCH** : partially update status of the specified WorkspaceKind
  - **PUT** : replace status of the specified WorkspaceKind

## /apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspacekinds

### HTTP method

**DELETE**

### Description

delete collection of WorkspaceKind

### HTTP responses

HTTP code	Response body
200 - OK	<b>Status</b> schema
401 - Unauthorized	Empty

### HTTP method

**GET**

### Description

list objects of kind WorkspaceKind

### HTTP responses

HTTP code	Response body
200 - OK	<code>WorkspaceKindList</code> schema
401 - Unauthorized	Empty

## HTTP method

POST

## Description

create a new WorkspaceKind

## Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized <code>dryRun</code> directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<code>fieldValidation</code>	<code>string</code>	<code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a <code>BadRequest</code> error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

## Body parameters

Parameter	Type	Description
body	WorkspaceKind schema	application/json formatted

## HTTP responses

HTTP code	Response body
200 - OK	WorkspaceKind schema
201 - Created	WorkspaceKind schema
202 - Accepted	WorkspaceKind schema
401 - Unauthorized	Empty

# /apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspacekinds/{name}

## HTTP method

DELETE

## Description

delete the specified WorkspaceKind

## Query parameters

Parameter	Type	Description
dryRun	string	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

## HTTP responses

HTTP code	Response body
200 - OK	<code>Status</code> schema
202 - Accepted	<code>Status</code> schema
401 - Unauthorized	Empty

## HTTP method

GET

## Description

read the specified WorkspaceKind

## HTTP responses

HTTP code	Response body
200 - OK	<code>WorkspaceKind</code> schema
401 - Unauthorized	Empty

## HTTP method

PATCH

## Description

partially update the specified WorkspaceKind

## Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<code>fieldValidation</code>	<code>string</code>	fieldValidation instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore:

Parameter	Type	Description
		This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a BadRequest error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

## HTTP responses

HTTP code	Response body
200 - OK	<code>WorkspaceKind</code> schema
401 - Unauthorized	Empty

## HTTP method

PUT

## Description

replace the specified WorkspaceKind

## Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Type	Description
<code>fieldValidation</code>	<code>string</code>	<p><code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are:</p> <ul style="list-style-type: none"> <li>- Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. # Workspace [kubeflow.org/v1beta1]

## Description

Workspace is the Schema for the Workspaces API

## Type

object

## Specification

Property	Type	Description
<code>apiVersion</code>	<code>string</code>	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
<code>kind</code>	<code>string</code>	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Property	Type	Description
<code>metadata</code>	<code>ObjectMeta</code>	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
<code>spec</code>	<code>object</code>	WorkspaceSpec defines the desired state of Workspace
<code>status</code>	<code>object</code>	WorkspaceStatus defines the observed state of Workspace

## .spec

### Description

WorkspaceSpec defines the desired state of Workspace

### Type

`object`

### Required

`kind`

`podTemplate`

Property	Type	Description
<code>deferUpdates</code>	<code>boolean</code>	if true, pending updates are NOT applied when the Workspace is paused if false, pending updates are applied when the Workspace is paused
<code>kind</code>	<code>string</code>	the WorkspaceKind to use

Property	Type	Description
<code>paused</code>	<code>boolean</code>	if the workspace is paused (no pods running)
<code>podTemplate</code>	<code>object</code>	options for "podTemplate"-type WorkspaceKinds

## `.spec.podTemplate`

### Description

options for "podTemplate"-type WorkspaceKinds

### Type

`object`

### Required

`options`

`volumes`

Property	Type	Description
<code>options</code>	<code>object</code>	the selected podTemplate options
<code>podMetadata</code>	<code>object</code>	metadata to be applied to the Pod resource
<code>volumes</code>	<code>object</code>	volume configs

## `.spec.podTemplate.options`

### Description

the selected podTemplate options

## Type

object

## Required

imageConfig

podConfig

Property	Type	Description
imageConfig	string	<p>the id of an imageConfig option</p> <ul style="list-style-type: none"> <li>options are defined in WorkspaceKind under <code>spec.podTemplate.options.imageConfig.values[]</code></li> </ul>
podConfig	string	<p>the id of a podConfig option</p> <ul style="list-style-type: none"> <li>options are defined in WorkspaceKind under <code>spec.podTemplate.options.podConfig.values[]</code></li> </ul>

## .spec.podTemplate.podMetadata

### Description

metadata to be applied to the Pod resource

### Type

object

Property	Type	Description
annotations	object	annotations to be applied to the Pod resource
labels	object	labels to be applied to the Pod resource

## .spec.podTemplate.podMetadata.annotations

### Description

annotations to be applied to the Pod resource

### Type

object

## .spec.podTemplate.podMetadata.labels

### Description

labels to be applied to the Pod resource

### Type

object

## .spec.podTemplate.volumes

### Description

volume configs

### Type

object

Property	Type	Description
<code>data</code>	<code>array</code>	<p>additional PVCs to mount</p> <ul style="list-style-type: none"><li>• these PVC must already exist in the Namespace</li><li>• the same PVC can be mounted multiple times with different <code>mountPaths</code></li><li>• if <code>readOnly</code> is false, the PVC must be RWX (ReadWriteMany, ReadWriteOnce)</li><li>• if <code>readOnly</code> is true, the PVC must be ReadOnlyMany</li></ul>

Property	Type	Description
<code>home</code>	<code>string</code>	<p>the name of the PVC to mount as the home volume</p> <ul style="list-style-type: none"> <li>this PVC must already exist in the Namespace</li> <li>this PVC must be RWX (ReadWriteMany, ReadWriteOnce)</li> <li>the mount path is defined in the WorkspaceKind under <code>spec.podTemplate.volumeMounts.home</code></li> </ul>

## `.spec.podTemplate.volumes.data`

### Description

additional PVCs to mount - these PVC must already exist in the Namespace - the same PVC can be mounted multiple times with different `mountPaths` - if `readOnly` is false, the PVC must be RWX (ReadWriteMany, ReadWriteOnce) - if `readOnly` is true, the PVC must be ReadOnlyMany

### Type

`array`

## `.spec.podTemplate.volumes.data[]`

### Type

`object`

### Required

`mountPath`

`pvcName`

Property	Type	Description
<code>mountPath</code>	<code>string</code>	the mount path for the PVC

Property	Type	Description
<code>pvcName</code>	<code>string</code>	the name of the PVC to mount
<code>readOnly</code>	<code>boolean</code>	if the PVC should be mounted as ReadOnly

## .status

### Description

WorkspaceStatus defines the observed state of Workspace

### Type

`object`

### Required

`activity`

`pauseTime`

`pendingRestart`

`podTemplateOptions`

`podTemplatePod`

`state`

`stateMessage`

Property	Type	Description
<code>activity</code>	<code>object</code>	activity information for the Workspace, used to determine when to cull
<code>pauseTime</code>	<code>integer</code>	<p>the time when the Workspace was paused (UNIX epoch)</p> <ul style="list-style-type: none"> <li>set to 0 when the Workspace is NOT paused</li> </ul>
<code>pendingRestart</code>	<code>boolean</code>	if the current Pod does not reflect the current "desired" state

Property	Type	Description
		<ul style="list-style-type: none"> <li>true if any <code>spec.podTemplate.options</code> have a redirect and so will be patched on the next restart</li> <li>true if the WorkspaceKind has changed one of its common <code>podTemplate</code> fields like <code>podMetadata</code>, <code>probes</code>, <code>extraEnv</code>, or <code>containerSecurityContext</code></li> </ul>
<code>podTemplateOptions</code>	<code>object</code>	information about the current podTemplate options (only set for WorkspaceKind of podTemplate kind)
<code>podTemplatePod</code>	<code>object</code>	information about the Pod managed by this Workspace (only set for WorkspaceKind of podTemplate kind)
<code>state</code>	<code>string</code>	the current state of the Workspace
<code>stateMessage</code>	<code>string</code>	<p>a human-readable message about the state of the Workspace</p> <ul style="list-style-type: none"> <li>WARNING: this field is NOT FOR MACHINE USE, subject to change without notice</li> </ul>

## .status.activity

### Description

activity information for the Workspace, used to determine when to cull

### Type

object

**Required**

lastActivity

lastUpdate

Property	Type	Description
lastActivity	integer	the last time activity was observed on the Workspace (UNIX epoch)
lastUpdate	integer	the last time we checked for activity on the Workspace (UNIX epoch)

**.status.podTemplateOptions****Description**

information about the current podTemplate options (only set for WorkspaceKind of podTemplate kind)

**Type**

object

**Required**

imageConfig

podConfig

Property	Type	Description
imageConfig	object	info about the current imageConfig option
podConfig	object	info about the current podConfig option

## `.status.podTemplateOptions.imageConfig`

### Description

info about the current imageConfig option

### Type

object

Property	Type	Description
<code>desired</code>	<code>string</code>	the option id which will take effect after the next restart
<code>redirectChain</code>	<code>array</code>	the chain from the current option to the desired option

## `.status.podTemplateOptions.imageConfig.redirectChain`

### Description

the chain from the current option to the desired option

### Type

array

## `.status.podTemplateOptions.imageConfig.redirectChain[]`

### Type

object

### Required

source

target

Property	Type	Description
source	string	the source option id
target	string	the target option id

## **.status.podTemplateOptions.podConfig**

### **Description**

info about the current podConfig option

### **Type**

object

Property	Type	Description
desired	string	the option id which will take effect after the next restart
redirectChain	array	the chain from the current option to the desired option

## **.status.podTemplateOptions.podConfig.redirectChain**

### **Description**

the chain from the current option to the desired option

### **Type**

array

## **.status.podTemplateOptions.podConfig.redirectChain[]**

## Type

object

## Required

source

target

Property	Type	Description
source	string	the source option id
target	string	the target option id

## .status.podTemplatePod

### Description

information about the Pod managed by this Workspace (only set for WorkspaceKind of podTemplate kind)

### Type

object

### Required

name

Property	Type	Description
containers	array	information about the Pod's containers
initContainers	array	information about the Pod's initContainers

Property	Type	Description
<code>name</code>	<code>string</code>	the name of the Pod resource

## `.status.podTemplatePod.containers`

### Description

information about the Pod's containers

### Type

`array`

## `.status.podTemplatePod.containers[]`

### Type

`object`

### Required

`name`

Property	Type	Description
<code>name</code>	<code>string</code>	the name of the container

## `.status.podTemplatePod.initContainers`

### Description

information about the Pod's initContainers

### Type

`array`

# .status.podTemplatePod.initContainers[]

## Type

object

## Required

name

Property	Type	Description
name	string	the name of the container

## API Endpoints

The following API endpoints are available:

- `/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspaces`
  - `DELETE` : delete collection of Workspace
  - `GET` : list objects of kind Workspace
  - `POST` : create a new Workspace
- `/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspaces/{name}`
  - `DELETE` : delete the specified Workspace
  - `GET` : read the specified Workspace
  - `PATCH` : partially update the specified Workspace
  - `PUT` : replace the specified Workspace
- `/apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspaces/{name}/status`
  - `GET` : read status of the specified Workspace
  - `PATCH` : partially update status of the specified Workspace
  - `PUT` : replace status of the specified Workspace

# /apis/kubeflow.org/v1beta1/namespaces/{namespace}/workspaces

## HTTP method

DELETE

## Description

delete collection of Workspace

## HTTP responses

HTTP code	Response body
200 - OK	<a href="#">Status</a> schema

`PUT`

## Description

replace status of the specified Workspace

## Query parameters

Parameter	Type	Description
<code>dryRun</code>	<code>string</code>	When present, indicates that modifications should not be persisted. An invalid or unrecognized <code>dryRun</code> directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
<code>fieldValidation</code>	<code>string</code>	<code>fieldValidation</code> instructs the server on how to handle objects in the request (POST/PUT/PATCH) containing unknown or duplicate fields. Valid values are: - Ignore: This will ignore any unknown fields that are silently dropped from the object, and will ignore all but the last duplicate field that the decoder encounters. This is the default behavior prior to v1.23. - Warn: This will send a warning via the standard warning response header for each unknown field that is dropped from the object, and for each duplicate field that is encountered. The request will still succeed if there are no other errors, and will only persist the last of any duplicate fields. This is the default in v1.23+ - Strict: This will fail the request with a <code>BadRequest</code> error if any unknown fields would be dropped from the object, or if any duplicate fields are present. The error returned from the server will contain all unknown and duplicate fields encountered.

## Body parameters

Parameter	Type	Description
<code>body</code>	<code>workspace</code> schema	<code>application/json</code> formatted

## HTTP responses

HTTP code	Response body
200 - OK	<code>workspace</code> schema
201 - Created	<code>workspace</code> schema
401 - Unauthorized	Empty
